## Preface to the Second Edition

---

*Operational Organic Chemistry* has been thoroughly reviewed and extensively rewritten for the second edition. The experimental sections have been reorganized; Part I now contains eleven experiments that cover all the major laboratory operations, and Part II contains thirty-nine experiments that are correlated with topics from a typical organic chemistry lecture course. Such correlations can be made for Part I experiments as well, but it is suggested that most of them (particularly the first five) be done early to teach the basic operations. Nine experiments are completely new: a simple introductory experiment that teaches acid-base chemistry and stoichiometry (Experiment 1); two experiments that explore different kinds of isomerism with the help of molecular models (12 and 16); a synthesis of a urea-inclusion complex (14); an aromatic bromination without  $\text{Br}_2$  (29); a synthetic experiment that also introduces linear free-energy relationships (34); a structure determination involving an uncommon reduction reaction (36); a synthetic/mechanistic experiment involving a molecular rearrangement (38); and a literature search that culminates in an organic synthesis (50). Eleven experiments (8, 11, 17, 18, 19, 26, 27, 28, 31, 33, and 47) have been extensively revised to include completely new procedures or yield different products. For example, the Williamson synthesis of phenetole that appeared in the first edition has been changed to a synthesis of phenacetin with a simplified procedure (26), and the aromatic nitration experiment (28) now uses nitronium fluoborate and includes a competitive rate study. The Procedure sections (and usually the Methodology sections as well) of the remaining experiments have been rewritten to reduce the amounts of chemicals, add more safety information, provide additional experience with spectral analysis, or in some cases make the experiments work better. Thirty new Minilabs have been added, and most of them are now described briefly in their associated experiments.

Most students liked the humor in the Situation sections in the first edition, but not all instructors were amused. In order that the Situations would not imply a casual attitude toward the task of teaching or learning organic chemistry in the laboratory, they were rewritten so that they coincide more closely with the given experimental objectives. The Experimental Variations that were included with each experiment in the first edition have been revised to include detailed procedures when appropriate, and these are presented under the new heading Collateral Projects. References to related experiments described elsewhere have been moved to the *Instructor's Manual*. Some of the Topics for Report have been moved to the Report sections that now follow the Procedure sections, and others will be found in the Exercises sections, which have been augmented by many new exercises.

The emphasis on laboratory safety in the first edition has been reinforced by the more frequent use of hazard warnings and handling precautions within

the experimental procedures. Several carcinogenic or particularly hazardous chemicals have been eliminated from experiments in this edition. Carbon tetrachloride has been replaced by Freon TF (1,1,2-trichlorotrifluoroethane), an essentially nontoxic solvent that can be purchased in quantity at a modest price (see the *Instructor's Manual* for suppliers). Chromium(VI) oxide has been replaced by aqueous sodium hypochlorite in the oxidation of isoborneol (Experiment 8), and two other experiments that used chromium(VI) reagents have been deleted. Thiamine hydrochloride has replaced sodium cyanide as the catalyst for the benzoin condensation (49). Chloroform is required for only one major experiment (19), and ethylene bromide, dioxane, and peroxybenzoic acid are not used at all.

In response to suggestions from many users of the first edition, infrared and nuclear magnetic resonance spectroscopy are employed to a much greater extent in this edition. IR or PMR spectra of starting materials are given in many experiments, and information about spectral interpretation has been added to the Methodology sections. Spectra of many products are included in the *Instructor's Manual*; they can be reproduced and distributed if it is impractical for students to record their own spectra. Part III, Qualitative Analysis, has been expanded to provide additional information about the interpretation of IR and PMR spectra. The operations dealing with IR and NMR spectrometry (OP-33 and OP-34) have been expanded to include descriptions of Fourier transform IR, carbon-13 NMR, and chemical-shift reagents. Experiment 48 now includes the interpretation of a mass spectrum, and the corresponding operation (OP-36) has been augmented accordingly. Most of the other descriptions of operations have required only minor revisions, but a section on HPLC has been added to the column chromatography operation (OP-16), and the gas chromatography operation (OP-32) has been expanded to cover open-tubular columns and McReynolds constants.

The Appendixes dealing with laboratory notebooks and checklists have been extensively revised in response to preferences expressed by users of the first edition. Appendix IV on stoichiometric calculations has been rewritten to reflect the widespread use of dimensional analysis techniques in general chemistry. The Bibliography has been updated to include many new sources published since 1980, and the description of bibliographic sources in Appendix VII has been revised accordingly. Experiment 50 contains an extensive section on searching the chemical literature, with detailed information about *Chemical Abstracts* and *Beilstein*.

Throughout the text, certain cross-references are given in angle brackets; these items can be found in the following parts of the book:

(OP-00): Part V, Operations, pages 597-775

(Bib-X00): Bibliography, pages A-37-A-49

(Test C-0): Part III, Classification Tests section, pages 551-565

(Procedure D-0): Part III, Derivatives section, pages 565-580

Instructors and laboratory coordinators should be aware that the *Instructor's Manual*, which is available free of charge from Allyn and Bacon, Inc., is an essential adjunct to any laboratory course that uses *Operational Organic Chemistry*.

### *Acknowledgments*

I wish to acknowledge the valuable contributions of Glenda Knigge and Nasser Kamazani, who lab-tested many new procedures; Bonnie Hoyer, who helped develop some procedures using Freon TF; Anne Marie Torcoletti and Linda Clancy, who tested procedures and catalysts for Experiment 33; Professor William Haag, who assisted me with the revision of Experiment 47; and Professor Gerald Weatherby, who provided a number of helpful suggestions. I am indebted to the many users of the first edition of *Operational Organic Chemistry* who completed a questionnaire; their responses and comments have been particularly helpful in the preparation of the second. Thanks are due to the administration of Lake Superior State University for approving a leave that provided the time to complete the manuscript and to the chemistry department of the University of Michigan for granting me visiting faculty appointments. I also wish to thank James M. Smith and Kathy Smith of Allyn and Bacon and Jane Hoover of Lifland et al., Bookmakers, who assisted me during the manuscript preparation and later stages of publication. Most of the spectra in this book and the *Instructor's Manual* are reproduced from the spectral libraries of the Aldrich Chemical Company, whose helpfulness and generosity are gratefully acknowledged.

J.W.L.

# Contents

---

Preface to the Second Edition	viii
Introduction	1
Laboratory Safety	8

## PART I MASTERING THE OPERATIONS

---

### EXPERIMENTS

- 1 The Conversion of Sodium Benzoate to Benzoic Acid 18
- 2 Separation of the Components of Panacetin 28
- 3 Identification of a Constituent of Panacetin 36
- 4 The Synthesis of Salicylic Acid from Wintergreen Oil 43
- 5 The Preparation of an Artificial Flavoring Ingredient 53
- 6 Identification of a Petroleum Hydrocarbon 63
- 7 Separation of Petroleum Hydrocarbons by Fractional Distillation 71
- 8 The Preparation of Camphor 79
- 9 The Isolation and Isomerization of Lycopene from Tomato Paste 87
- 10 Isolation and Identification of a Local Anesthetic from Cloves 96
- 11 Identification of Unknown Ketones by NMR Spectrometry and Thin-Layer Chromatography 104

### MINILABS

- 1 Purification of an Unknown Compound by Recrystallization 41
- 2 Synthesis of Methyl Benzoate (Oil of Niobe) 61
- 3 Analysis of Commercial Xylene by Gas Chromatography 77
- 4 The Optical Rotation of Turpentine 85
- 5 Separation of Spinach Pigments by Paper Chromatography 94
- 6 Purification of  $\alpha$ -Terpinenol by Vacuum Distillation 102
- 7 TLC Analysis of an Analgesic Drug 111

## PART II CORRELATED LABORATORY EXPERIMENTS

---

### EXPERIMENTS

- 12 Isomers and Isomerization Reactions 114
- 13 Properties of Representative Carbon Compounds 123
- 14 Preparation of the Urca-Inclusion Complex of an Alkane 134
- 15 Preparation of Triphenylmethyl Bromide and the Trityl Free Radical 142

### MINILABS

- 8 Identification of a Terpenoid by Infrared Analysis 132
- 9 Free-Radical Bromination of Hydrocarbons 149

**EXPERIMENTS**

- 16 Structures and Properties of Stereoisomers 151
- 17 Bridgehead Reactivity in Solvolysis Reactions of Tertiary Alkyl Bromides 159
- 18 The Dehydration of Methylcyclohexanols 168
- 19 The Synthesis of 7,7-Dichloronorcaradiene Using a Phase-Transfer Catalyst 180
- 20 Stereochemistry of the Addition of Bromine to *trans*-Cinnamic Acid 191
- 21 Chain-Growth Polymerization of Styrene and Methyl Methacrylate 200
- 22 Hydration of a Difunctional Alkyne 211
- 23 Identification of a Conjugated Diene from Eucalyptus Oil 221
- 24 The Synthesis of Triphenylmethanol and the Trityl Carbenium Ion 230
- 25 The Reaction of Butanols with Hydrobromic Acid 242
- 26 Preparation of Phenacetin by the Williamson Ether Synthesis 253
- 27 Preparation of Nonbenzenoid Aromatic Compounds 262
- 28 Mechanism of the Nitration of Arenes by Nitronium Fluoborate 275
- 29 The Bromination of Acetophenone by Potassium Bromate 285
- 30 The Friedel-Crafts Acylation of Anisole 296
- 31 Determination of the Structure of a Natural Product in Anise Oil 306
- 32 The Borohydride Reduction of Vanillin to Vanillyl Alcohol 315
- 33 The Effect of Reaction Conditions on the Condensation of Furfural with Cyclopentanone 326
- 34 The Electronic Effect of a *para*-Iodo Substituent 336
- 35 Shifting the Equilibrium in an Esterification Reaction 348
- 36 Synthesis and Identification of an Unknown Carboxylic Acid 357
- 37 Preparation of the Insect Repellent *N,N*-Diethyl-*meta*-Toluamide 365

**MINILABS**

- 10 Nucleophilic Substitution Reactions of Alkyl Bromides 166
- 11 Preparation and Properties of a Gaseous Alkene 178
- 12 The Effect of Ring Strain in an Addition Reaction 190
- 13 Determination of Unsaturation in Commercial Products 198
- 14 The Nylon Rope Trick 208
- 15 Diels-Alder Reaction of Maleic Anhydride and Furan 228
- 16 Preparation of Fluorescein 240
- 17 Nucleophilic Substitution Rates of Alcohols 251
- 18 Preparation of Ethoxytriphenylmethane 260
- 19 Preparation of Tropylium Iodide 272
- 20 Nitration of Naphthalene 283
- 21 Reaction of Acetophenone with Sodium Hypochlorite 294
- 22 Friedel-Crafts Reactions of Aromatic Hydrocarbons 304
- 23 Air Oxidation of Fluorene to Fluorenone 313
- 24 Photoreduction of Benzophenone to Benzpinacol 324
- 25 Preparation of Dibenzalacetone 334
- 26 Synthesis of Benzoic Acid from Benzaldehyde 346
- 27 Hydrolysis Rates of Esters 355
- 28 Preparation of Succinic Anhydride 363
- 29 Preparation of Benzamide 376

**EXPERIMENTS**

- 38** The Reaction of Phthalimide with Sodium Hypochlorite 378  
**39** Synthesis of Sulfa Drugs from Acetanilide 389  
**40** The Preparation of Para Red and Related Azo Dyes 400  
**41** The Synthesis and Spectral Analysis of Aspirin 410  
**42** Nucleophilic Strength and Reactivity in  $S_NAr$  Reactions 420  
**43** The Enamine Synthesis of 2-Propionylcyclohexanone 429  
**44** Synthesis of Dimedone and Measurement of its Tautomeric Equilibrium Constant 439  
**45** Analysis of Fatty Acid Content of Commercial Cooking Oils and Fats 449
- 46** Determination of the Structure of an Unknown Aldohexose 460  
**47** Determination of the Structure of an Unknown Dipeptide 470  
**48** The Preparation of 2-Phenylindole 482  
**49** The Multistep Synthesis of Benzilic Acid from Benzaldehyde 494  
**50** Using the Chemical Literature in an Organic Synthesis 504

**MINILABS**

- 30** The Beckmann Rearrangement of Benzophenone Oxime 386
- 31** Diazotization and Hydrolysis of Anthranilic Acid 408
- 32** Identification of an Aryl Chloride in Moth Flakes 427
- 33** Synthesis of Dimedone Derivatives of Benzaldehyde 446
- 34** Preparation of a Soap Using a Phase-Transfer Catalyst 457  
**35** Extraction of Trimyristin from Nutmeg 458  
**36** Preparation of 1,2:4,5-Di-O-cyclohexylidene-D-fructopyranose 468  
**37** Isolation of Casein from Milk 480
- 38** Dyeing with Indigo 492  
**39** Synthesis of 2,3-Diphenylquinoxaline from Benzil 502

**PART III SYSTEMATIC ORGANIC QUALITATIVE ANALYSIS**

---

Background: The Chemist as Detective 518  
Methodology 521

Procedures 549

Report 581

Preliminary Work 521  
Functional-Class Determination 522  
Spectral Analysis 525  
Identification 545  
Preliminary Work 549  
Solubility Tests 549  
Spectral Analysis (Optional) 550  
Classification Tests 551  
Derivatives 565

**PART IV ADVANCED PROJECTS**

---

- 1 Isolation and Testing of a Natural Growth Inhibitor 586
- 2 Isolation and Analysis of an Essential Oil 587
- 3 Isolation and Identification of Pigments from Wild Plants 588
- 4 The Effect of Molecular Modification on Odor 589
- 5 Stereochemistry of a Hydride Reduction of 4-*t*-Butylcyclohexanone 590
- 6 Comparison of the Migratory Aptitudes of Aryl Groups 591
- 7 Investigation of the Relative Stability of Endocyclic and Exocyclic Double Bonds 592
- 8 Synthesis and Activity of Cockroach Sex Pheromone Mimics 593
- 9 Preparation of a New Organic Compound 594

**PART V THE OPERATIONS**

---

## Elementary Operations

**OPERATIONS**

- 1 Cleaning and Drying Glassware 598
- 2 Using Standard-Taper Glassware 599
- 3 Using Corks and Rubber Stoppers 603
- 4 Basic Glass Working 605
- 5 Weighing 607

## Operations for Conducting Chemical Reactions

- 6 Measuring Volume 608
- 7 Heating 611
- 7a Refluxing 617
- 7b Semimicro Refluxing 619
- 7c Temperature Monitoring 619

## Separation Operations

- 8 Cooling 620
- 9 Mixing 622
- 10 Addition 623
- 10a Semimicro Addition 625
- 11 Gravity Filtration 626
- 12 Vacuum Filtration 627
- 12a Semimicro Vacuum Filtration 630
- 13 Extraction 630
- 13a Semimicro Extraction 635
- 13b Separation of Liquids 636
- 13c Salting Out 636
- 13d Solid Extraction 637
- 14 Evaporation 637
- 15 Codistillation 640
- 15a Steam Distillation 643
- 16 Column Chromatography 646
- 17 Thin-Layer Chromatography 655
- 18 Paper Chromatography 662
- 19 Washing Liquids 667
- 20 Drying Liquids 668

## Washing and Drying Operations

## Purification Operations

## Measurement of Physical Constants

## Instrumental Analysis

**OPERATIONS**

- 21 Drying Solids 671
- 22 Drying Gases 674
- 22a Excluding Moisture 675
- 22b Trapping Gases 675
- 23 Recrystallization 677
- 23a Semimicro Recrystallization 683
- 23b Recrystallization from Mixed Solvents 684
- 23c Choosing a Recrystallization Solvent 685
- 24 Sublimation 688
- 24a Vacuum Sublimation 689
- 25 Simple Distillation 690
- 25a Semimicro Distillation 698
- 25b Distillation of Solids 699
- 25c Water Separation 699
- 26 Vacuum Distillation 701
- 26a Semimicro Vacuum Distillation 709
- 27 Fractional Distillation 709
- 28 Melting-Point Determination 719
- 29 Boiling-Point Determination 726
- 29a Micro Boiling-Point Determination 728
- 30 Measuring the Refractive Index 730
- 31 Measuring Optical Rotation 733
- 32 Gas Chromatography 738
- 33 Infrared Spectrometry 746
- 34 Nuclear Magnetic Resonance Spectrometry 756
- 35 Ultraviolet-Visible Spectrometry 765
- 35a Colorimetry 768
- 36 Mass Spectrometry 770

**APPENDIXES AND BIBLIOGRAPHY**

# Introduction

---

## *Purpose and Organization of the Book*

*Operational Organic Chemistry* is about organic chemistry as it is practiced in the laboratory. It is intended to be more than just a compilation of procedures that, if followed step by step, eventually result in the accumulation of data or the preparation of organic substances. It is a *textbook* of experimental chemistry that will help you learn how to perform the fundamental operations of organic chemistry in the laboratory and how to apply them intelligently in new situations. A cook must learn such basic techniques as peeling, slicing, and grating before he or she can prepare an adequate meal; you will have to learn such operations as extraction, distillation, and recrystallization before you can prepare an organic compound such as aspirin or isoamyl acetate. A *good* cook does not follow a recipe mechanically but possesses sufficient understanding of the methodology of cooking to improvise. If you unthinkingly follow a "recipe" for aspirin, you are not going to learn much about aspirin in the process, nor will you understand the reasons for what you are doing or the chemistry involved in the synthesis. You may have gone through the motions of making aspirin, but you will have no idea how to apply what you have done to a different preparation. Some students approach a chemistry experiment as if it were a one-of-a-kind phenomenon—they follow the directions, write up a report, and promptly forget about it. But no experiment in this book is unique; each consists of a set of interrelated operations performed in a logical sequence, and the lessons learned in one experiment will be applied to other experiments.

This book is divided into five parts, preceded by the Laboratory Safety section. Part I contains eleven experiments whose purpose is to help you learn the basic operations by applying them to a preparation or to the solution of a specific problem. For example, you will measure a melting point not only to learn *how* to measure a melting point, but also to establish the identity of a substance you have isolated or synthesized. Many of the operations will be reinforced by repeated application in the experiments in Part I so that you can master them. Once you are familiar with the operations, you will use them in the experiments in Part II, which are correlated with topics from the lecture course. The best way to learn most theoretical concepts is to apply them in the laboratory; in this way, their relationship to the "real world" of organic chemistry can be better understood and appreciated. The thirty-nine experiments in Part II will give you practical experience in dealing with the concepts of organic chemistry and will increase your proficiency in the laboratory. Part III is a comprehensive, self-contained introduction to organic qualitative analysis that will teach you how to identify organic compounds using chemical and spectral methods. Some experiments in Parts I and II

contain references in the forms <Test C-19> and <Procedure D-4>. These refer to the chemical tests and preparations of derivatives described in Part III on pages 551-580. Part IV describes some challenging, open-ended research projects that you should undertake only if you are an advanced or highly motivated student. Part V contains the descriptions of all the operations that are referred to by number in the experiments in the form <OP-5>. Appendixes I through V contain illustrations of laboratory equipment and information about laboratory notebooks, reports, experimental plans, and calculations. Appendix VI contains tables of properties for qualitative analysis. Appendix VII describes many of the sources mentioned in the Bibliography entries and serves as a guide to the literature of chemistry; in conjunction with Experiment 50, it will help you to carry out a comprehensive literature search. References to entries listed in the Bibliography are made throughout the text in the form <Bib-F7>, where the letter refers to a category and the number to a location within that category; for example, F7 is the seventh book listed under category F (Spectroscopy).

### *Organization of the Experiments*

Immediately following the title of each experiment is a list of topics that classify the experiment and correlate its contents with textbook material. For the synthetic experiments, this list generally includes the kind of compound reacting, the kind of compound being synthesized, the reaction type, and significant intermediates.

Each experiment also includes material under some or all of the following headings.

*Operations.* Most or all of the operations used in an experiment are listed at the beginning of the experiment. These Operations lists include general separation or analytical methods (such as gas chromatography and NMR spectrometry) as well as basic laboratory techniques (such as vacuum filtration). Each operation is identified by an operation number, such as OP-12 for vacuum filtration, and the description of an operation can be located quickly using the special headings at the top of the odd-numbered pages in Part V. In the Operations lists, the numbers printed in boldfaced type indicate operations being used for the first time; you should read these descriptions thoroughly before you come to the laboratory. Once you have used an operation, you should not have to reread the entire description the next time you use it, but you should at least read the Summary and review the Operational Procedure to refresh your memory. Eventually you should have to refer to the operation descriptions only if you encounter experimental difficulties or are applying an operation in a new situation.

*Objectives.* Each experiment is designed to fulfill a number of objectives, which usually include both experimental objectives that will be met by

successful completion of the experiment (such as preparing a specified compound or identifying an unknown) and learning objectives relating to information, methods, and theoretical concepts that will be learned or reinforced as you carry out the experiment.

*Situation.* Many scientists study more or less familiar objects that can be readily observed, like stars, minerals, or ring-tailed wombats, but chemists deal with fundamental particles that cannot be seen or fully understood. It is easier to empathize with a wombat than with a molecule of *N,N*-diethyl-*meta*-toluamide ("Deet" for short; see Experiment 37)—even though the Deet is a more practical companion for a trek through the woods. Thus, nonchemists seldom understand just what motivates chemists to seek out and solve research problems that pertain to the invisible world of atoms and molecules. Each experiment is introduced by a Situation section intended to give you an appreciation of organic chemistry as a problem-solving endeavor rather than a collection of dry facts. Most Situations portray research problems of the kind that are encountered by professional chemists; some are more fanciful and need not be taken too seriously. In all cases, their purpose is to help you approach each experiment as a stimulating challenge to be met rather than an ordeal to be endured.

*Background.* Chemistry is an *experimental* science—the concepts of chemistry are based on observations of chemical phenomena, and no theory can stand for long without a solid foundation of experimental facts. A major purpose of any laboratory course is to put into practice the theoretical concepts dealt with in lectures. If you do not see the relationship between an experiment and the associated lecture material, the main point of the experiment will be lost. The Background section in each experiment is intended to serve as a link between the experimental work and the related concepts that are presented in the lecture course. This section may also relate historical sidelights or interesting facts that show the relevance of the experiment to the real world.

*Methodology.* A laboratory course gives you an opportunity to learn by experience, but you will not learn much of value unless you appreciate the significance of the experience at the time. If you follow a procedure mechanically without understanding the purpose of each step, you will be unprepared to deal with unexpected complications when they arise, to modify the procedure when necessary, or to take a shortcut when the situation warrants it. The Methodology section of an experiment describes and explains the experimental approach and may provide additional information that can help you interpret your results or cope with experimental situations as they arise.

*Prelab Assignments.* You should always read through the entire assigned experiment *before* you come to the laboratory, paying particular attention to

the Methodology and Procedure sections. The Prelab Assignments section of an experiment lists additional tasks to be completed before the lab period, such as reading operations, performing calculations, or writing an experimental plan. Ordinarily you will not be allowed to begin an experiment until your prelab write-up has been approved by the instructor.

*Reactions and Properties.* The Reactions and Properties section gives balanced equations for the relevant reactions and tabulates the physical properties of reactants, products, and certain other chemicals. The Properties table provides the data needed for most of the prelab calculations.

*Procedure.* Many of the experimental procedures in Part I are spelled out in considerable detail so as to inform or remind you of necessary steps that you might otherwise overlook. In most Part II experiments, the procedures are considerably less detailed. By the time you get to Part II, you will be expected to know how to perform most operations proficiently without the aid of frequent reminders. You should therefore regard the Procedure section more as a guide to the laboratory work than as a set of step-by-step instructions.

*Safety Precautions.* The characteristics of some hazardous chemicals and precautions for their use are described under a separate heading that appears in the Procedure sections of experiments in which such chemicals are used. See the Laboratory Safety section (pages 8–15) for general information about hazardous chemicals.

*Report.* The Report section of an experiment describes specific calculations, analytical data, or other information that should be incorporated into your laboratory report. Your instructor will describe the format you should follow and indicate any additional material that should be included in lab reports. In many cases it will be necessary to read the Background and Methodology sections thoroughly in order to complete your report or the assigned exercises.

*Collateral Projects.* The Collateral Projects section describes additional projects that are related to the basic experiment. You are encouraged to complete as many of the projects as you have time for, but you must obtain your instructor's permission before starting any unassigned project.

*Minilabs.* A short, self-contained Minilab is included with most of the experiments. Although each Minilab is associated with an experiment that is related in subject matter, you do not have to carry out a Minilab in conjunction with its experiment. Do not start any unassigned Minilab without first receiving permission from your instructor.

*Exercises.* Your instructor will assign some of the Exercises to be completed and submitted with your laboratory report.

*Library Topics.* The assignments in the Library Topics section are intended to help you become more familiar with the chemical literature, which is described in Appendix VII. Your instructor may make specific assignments or allow you to choose your own. Information on most topics can be found in sources in the Bibliography, particularly under category L.

### *Laboratory Organization*

Because of wide variations in individual working rates, it is usually not possible to schedule experiments so that everyone can be finished in the allotted time; if all laboratories were geared to the slowest student, the objectives of the course could not be accomplished in the limited time available. As a result, some students will invariably get behind during a lab period and find it necessary to put in extra hours outside their scheduled laboratory section in order to complete the course. The students who fall into this group do not necessarily lack ability—some of the brightest students may also be among the slowest—but they are usually not well organized and thus fail to make the best use of their time. The following suggestions should help you work more efficiently in the laboratory:

1. *Be prepared to start the current experiment the moment you reach your work area.* Don't waste the precious minutes at the start of a laboratory period doing calculations, reading the experiment, washing glassware, or carrying out other activities that should have been performed at the end of the previous period or during the intervening time. The first half hour of any lab period is the most important—if you can use it to collect your reagents, set up the apparatus, and get the initial operation (reflux, distillation, etc.) under way, you should be able to complete the experiment in the designated time period.

2. *Organize your time effectively.* Set up a regular schedule that allows you to read the experiment and the operation descriptions a day or two before the laboratory period—an hour before the lab is much too late! Plan ahead so that you know approximately what you will be doing at each stage of the experiment. A written experimental plan, prepared as described in Appendix V, is invaluable for this purpose.

3. *Organize your work area.* Before performing any operation, all of the equipment and supplies you will need to use during the operation should be set out neatly on your bench top in approximately the order in which they will be used. Small objects like spatulas and any item that might be contaminated by contact with the bench top should be placed on a paper towel, laboratory tissue, or mat. After each item is used, it should be removed to an out-of-the-way location (for example, dirty glassware to a washing trough in the sink) where it can be cleaned and then returned to its proper location when time permits. It is important to keep your locker well organized, with each item placed in a specific location when not in use, so that you can

immediately find the equipment you need. This will also enable you to notice when a piece of equipment has been misplaced or stolen, so it can be hunted down or reported to the instructor without delay.

### *Laboratory Etiquette*

Although a little courtesy does help maintain peace and harmony in any work situation, this section is not about “good manners” as such. It is a set of common-sense rules that must be observed if the laboratory is to be a place where students can work together safely and efficiently.

**1. Return all chemicals and supplies to the proper location after use.** You will understand the reason for this rule if you ever experience the aggravation of hunting high and low for a reagent, only to find it at another student's station in a far corner of the lab. Chemicals that are being weighed out may be left at the balance if there are students waiting to use them; otherwise, they should be returned to the reagent shelves. Containers should be taken to the reagents to be filled; reagent bottles should not be taken to your lab station.

**2. Measure out only what you need.** Liquids and solutions should be measured into graduated containers so that you will take no more than you expect to use for a given operation. Solids can usually be weighed directly from their containers or measured from a special solids dispenser.

**3. Prevent contamination of reagents.** Do not use pipets or droppers to remove liquids from reagent bottles, and do not return unused reagent to a stock bottle. Be sure to close all bottles tightly after use — particularly those containing anhydrous chemicals and drying agents.

**4. When you must use a burner in the lab, tell your neighbors, unless they are already using burners.** This will enable them to cover any containers of flammable solvents and to limit or modify their use of such solvents during your operation. In certain circumstances, for example, when ether extractions are being performed, you should use a different heat source, move your operation to a safe location (for instance, under a fume hood) or find something else to do while flammable solvents are in use.

**5. Leave all community property where you found it.** Some items, such as ringstands, steam baths, lab kits, clamps, and condenser tubing, may not be supplied in student lockers. Such items are often part of the standard equipment found at each laboratory station, or they are obtained from the stockroom at the beginning of the laboratory period. Since such items may be needed by students in other lab sections, they should always be returned to the proper storage space at the end of the period.

**6. Clean up for the next person.** There are few experiences more annoying than finding that the lab kit you just checked out is full of dirty glassware, or that your lab station is cluttered with paper towels, broken glass, and
