VACCINE PREPARATION TECHNIQUES 1980

Edited by J.I. Duffy

Worldwide vaccination programs have the eradication of specific diseases as their goal, and basic immunization with killed or inactivated antigens has become standard practice.

Precipitated or adsorbed preparations, as shown in this book, are more stable and will induce a longer-lasting immune response than pure fluid preparations, although both types are usually administered by injection.

Influenza vaccines, whether killed or live, have not so far been very successful, but new substances, like interferon and the transfer factor, may be instrumental in conferring an immunity that goes far beyond the antigen-antibody response of traditional vaccine technology.

Animal husbandry has received a decided boost with many of the advances in vaccines against animal diseases. Methods of increasing antibody production in the colostrum is a focus of many of the processes described here in detail.

A summarized table of contents follows here with **chapter headings and examples of subtitles**. Numbers in () are numbers of topics.

1. HUMAN ANTIVIRAL VACCINES (40)

- Hepatitis A Antigen from Stools
- Isolation of Hepatitis B Surface Antigen by Isopyknic Banding
- Purification Using Terminal Aminononyl or Aminodecyl Groups
- Purification Utilizing Concanavalin A
- Pyrogen-Free Influenza Vaccine
- Recombinant, Antigenically Hybridized Virus
- Aggregated Influenza Virus
- Temperature-Sensitive Varicella-Zoster Virus
- Cytomegalovirus
- Passage in Fibroblasts
- Respiratory Syncytial Vaccine
- Mumps Vaccine

2. ANIMAL ANTIVIRAL VACCINES (20)

- Rabies Virus Producing Consistent Cytopathic Effect
- Transmissible Gastroenteritis
- Equine Rhinopneumonitis
- Foot-and-Mouth Disease/Maul- und Klauenseuche
- Purified Capsid Protein
- Feline Calicivirus Vaccine

Vaccine Against Viral Pericarditis in Barbary Ducks

3. INTERFERON (21)

- Interferon Induction
- Double-Stranded RNA from Basidiomycetes
- Double-Stranded RNA/Polycation Complex
- Exogenous Interferon
- Production by Trypsinized Cells

4. ANTIBACTERIAL VACCINES (39)

- Meningitis
- Cholera
- Tetanus
- Acne Vulgaris
- Pseudomonas aeruginosa
- Dental Caries
- Glucosyltransferase Antigens
- Enteritis
- Parenteral-Oral Vaccine of Treponema hyodysenteriae

5. ANTITUMOR VACCINES (14)

- Drug-Antibody Conjugates
- Antileukemia Agent
- Production of Marek's Disease Vaccine

6. ALLERGY VACCINES (8)

- Tyrosine Micro-Particles

7. PASSIVE IMMUNOLOGICAL PREPARATIONS (17)

- Disease-Specific Immunoglobulins
- Transfer Factor
- Orally Active Transfer Factor
- Preparation of Ichorin
- Colostrum Antibodies
- Preparation of Bovine Colostrum

8. OTHER VACCINE PREPARATIONS (13)

- Contraceptive Vaccines
- Male Contraception by FSH
- Inflammatory Diseases
- Cross-Linked Orgotein
- Method of Vaccinating Aquatic Animals

9. IMMUNOSTIMULANTS AND ADJUVANTS (27)

- Bacterial Adjuvants
- Isomannide Monooleate/Aluminum Monostearate Water-Oil Emulsions
- Viral-Antigen-Binding Substances
- Negatively Charged Liposomes

10. IMPROVED VACCINE PROCESSING (23)

- Cultures and Growth Media
- Eucaryotic Cells in Solid Carrier
- Microcapsules in the Nanometric Range

FOREWORD

The detailed, descriptive information in this book is based on U.S. patents issued since January 1975 that deal with recent advances in the manufacture of chemicals by enzymatic and microbial processes.

This book is a data-based publication, providing information retrieved and made available from the U.S. patent literature. It thus serves a double purpose in that it supplies detailed technical information and can be used as a guide to the patent literature in this field. By indicating all the information that is significant, and eliminating legal jargon and juristic phraseology, this book presents an advanced commercially oriented review of the manufacture of chemicals by enzymatic and microbial processes. This title supersedes our previous title *Chemicals by Fermentation*, published in 1973.

The U.S. patent literature is the largest and most comprehensive collection of technical information in the world. There is more practical, commercial, timely process information assembled here than is available from any other source. The technical information obtained from a patent is extremely reliable and comprehensive; sufficient information must be included to avoid rejection for "insufficient disclosure." These patents include practically all of those issued on the subject in the United States during the period under review; there has been no bias in the selection of patents for inclusion.

The patent literature covers a substantial amount of information not available in the journal literature. The patent literature is a prime source of basic commercially useful information. This information is overlooked by those who rely primarily on the periodical journal literature. It is realized that there is a lag between a patent application on a new process development and the granting of a patent, but it is felt that this may roughly parallel or even anticipate the lag in putting that development into commercial practice.

Many of these patents are being utilized commercially. Whether used or not, they offer opportunities for technological transfer. Also, a major purpose of this book is to describe the number of technical possibilities available, which may open up profitable areas of research and development. The information contained in this book will allow you to establish a sound background before launching into research in this field.

Advanced composition and production methods developed by Noyes Data are employed to bring these durably bound books to you in a minimum of time. Special techniques are used to close the gap between "manuscript" and "completed book." Industrial technology is progressing so rapidly that time-honored, conventional typesetting, binding and shipping methods are no longer suitable. We have bypassed the delays in the conventional book publishing cycle and provide the user with an effective and convenient means of reviewing up-to-date information in depth. The table of contents is organized in such a way as to serve as a subject index. Other indexes by company, inventor and patent number help in providing easy access to the information contained in this book.

16 Reasons Why the U.S. Patent Office Literature Is Important to You

- 1.** The U.S. patent literature is the largest and most comprehensive collection of technical information in the world. There is more practical commercial process information assembled here than is available from any other source. Most important technological advances are described in the patent literature.
- 2.** The technical information obtained from the patent literature is extremely comprehensive; sufficient information must be included to avoid rejection for "insufficient disclosure."
- 3.** The patent literature is a prime source of basic commercially utilizable information. This information is overlooked by those who rely primarily on the periodical journal literature.
- 4.** An important feature of the patent literature is that it can serve to avoid duplication of research and development.
- 5.** Patents, unlike periodical literature, are bound by definition to contain new information, data and ideas.
- 6.** It can serve as a source of new ideas in a different but related field, and may be outside the patent protection offered the original invention.
- 7.** Since claims are narrowly defined, much valuable information is included that may be outside the legal protection afforded by the claims.
- 8.** Patents discuss the difficulties associated with previous research, development or production techniques, and offer a specific method of overcoming problems. This gives clues to current process information that has not been published in periodicals or books.
- 9.** Can aid in process design by providing a selection of alternate techniques. A powerful research and engineering tool.
- 10.** Obtain licenses—many U.S. chemical patents have not been developed commercially.
- 11.** Patents provide an excellent starting point for the next investigator.
- 12.** Frequently, innovations derived from research are first disclosed in the patent literature, prior to coverage in the periodical literature.
- 13.** Patents offer a most valuable method of keeping abreast of latest technologies, serving an individual's own "current awareness" program.
- 14.** Identifying potential new competitors.
- 15.** It is a creative source of ideas for those with imagination.
- 16.** Scrutiny of the patent literature has important profit-making potential.

CONTENTS AND SUBJECT INDEX

INTRODUCTION	1
ORGANIC ACIDS	3
Citric Acid	3
Organic Acid as Carbon Source	3
Slack Wax as Carbon Source	4
Production from Olefins	6
Carbon Source as By-Product of Fructose Production	7
Addition of Monofluoroacetic Acid or Alcohol	8
Addition of Sodium Hydroxide	11
Addition of Refined Steel	12
Production Using Ferrous Salts	13
Addition of Potassium Ferrocyanide	14
Addition of Nitrogenous Heterocyclic Organic Compounds	17
Production Using Cyanoacetic Acid	19
Production from Lysine-Enriched Yeasts	20
Production Using <i>Saccharomyopsis lipolytica</i>	22
Diploid Strain of <i>Candida lipolytica</i> and Thiamin	23
Direct Production of Free Acid	24
Use of Two Air Supply Systems	25
L-Tartaric Acid	27
Production from <i>Acetobacter</i> and <i>Corynebacteria</i> Microorganisms	27
Production from <i>Achromobacter</i> and <i>Alcaligenes</i> Microorganisms	30
Production from <i>Nocardia</i> Microorganisms	32
Production from <i>Pseudomonas</i> , <i>Agrobacterium</i> or <i>Rhizobium</i>	
Microorganisms	33
Addition of Nonionic Surfactant	35
Poly-(β -Hydroxybutyric Acid)	37
Selection of Bacterial Strains	37
Method of Extraction	37
L-Malic Acid	39
Production from <i>Paracolobactrum aerogenoides</i>	39
Immobilization of Microorganism	39

Contents and Subject Index

Miscellaneous Organic Acids	41
Hydrolyzation of Nitriles	41
Dicarboxylic Acids from <i>Torulopsis candida</i>	42
Dicarboxylic Acids from <i>Torulopsis bombicola</i>	43
L-2-Amino-4-Methoxy-trans-3-Butenoic Acid	45
L-2-Amino-4-(2-Aminoethoxy)-Butanoic Acid	46
Long-Chain α -Hydroxyalkanoic Acids.	48
Itaconic Acid.	50
Urocanic Acid	52
Pyruvic Acid	54
Aldonic Acids	55
 AMINO ACIDS, PEPTIDES AND PROTEINS	58
Alanine	58
L-Alanine	58
D-Alanine	59
Arginine	61
<i>Bacillus</i> Mutant Having Nutritional Requirement	61
Pyrimidine-Metabolic-Antagonist-Resistant Bacterial Strains.	62
Arginine-Analogue-Resistant Bacterial Strains.	63
Aspartic Acid	64
Production from Fumaric Acid	64
Strains Resistant to 6-(Dimethylamino)Purine	66
Fermentation of Hydrocarbons.	66
Cysteine and Cystine.	69
Use of Cysteine Desulphydrase	69
Production from 2-Aminothiazoline-4-Carboxylic Acid	70
Glutamic Acid.	72
Production from <i>Micrococcus glutamicus</i>	72
Addition of Surfactants.	74
Production Using Methanol.	75
Use of Ammonium Acetate.	76
Protein Hydrolysate Containing Glutamic Acid.	78
Histidine	80
Production from <i>Serratia marcescens</i> Mutant	80
2-Thiazolealanine-Resistant Bacterial Strain	81
Leucine.	83
Bacterial Strains Requiring Isoleucine, Threonine or Methionine	83
Leucine-Antagonist-Resistant Bacterial Strains	84
Lysine	85
Production Using Antibiotics, Surface-Active Agents and Antioxidants	85
Use of Methanol	86
L-Lysine Analogues as Metabolic Antagonists	88
Production Using <i>Brevibacterium</i> or <i>Corynebacterium</i> Mutants	90
Production from <i>Corynebacterium glutamicum</i>	91
Production from <i>Nocardia alkanoglutinosa</i>	92
Production Using an <i>Acinetobacter</i> Strain.	94
AEC-Resistant <i>Corynebacterium</i> Strain.	95
Production from L-Valine-Resistant Microorganism	96
Production from Mixed Microorganisms	99
Use of L-Leucine-Producing Microorganism	101
Optical Resolution of DL-Lysine.	101
Methionine	103

Production from DL-N-Carbamoylmethionine	103
N-Acyl-L-Methionine	105
Phenylalanine	107
Tyrosine-Requiring Strain of <i>Brevibacterium</i>	107
Production from <i>Microbacterium ammoniaphilum</i>	108
Serine	109
Production Using <i>Pseudomonas</i> sp. DSM 672	109
Production from Mutant Strains of <i>Corynebacterium glycinophilum</i>	110
Serine and Serinol Derivatives	112
Tryptophan	114
Production from Indole and β -Chloroalanine	114
Production from Indole and Methanol	116
Tryptophan Derivatives from <i>Candida humicola</i>	117
L-5-Methoxytryptophan	119
Other Amino Acids	121
Citrulline	121
Glutamine	123
Valine	124
Miscellaneous Processes	126
Amino Acid Production from Hydrogen-Oxidizing Bacteria	126
Amino Acids from Aldehyde-Containing Hydrocarbons	126
Sulfur-Containing L-Amino Acids	128
Optically Active Amino Acids from Hydantoin Compounds	130
Optical Resolution of N-Acylamino Acids	134
Optically Active α -Amino Acids from Racemic α -Amino Acid Amides	136
Decarboxylation of Amino Acids	139
Peptides	140
Dipeptide Derivative and Amino Acid Derivative Addition Compounds	140
Hydrolysis of Soy Protein	142
Use of Serine or Thiol Proteinase	143
Use of Metalloproteinase	144
N-Acypentapeptides	144
Modification of Porcine or Bovine Insulin	145
Proteins	148
Extraction of Microbial Cellular Proteins	148
Protein from <i>Cellulomonas</i> Strain	149
Single-Cell Protein from Methanol	151
Glycoproteins	152
Glucoproteins	154
Metal Proteinates	155
Ammonia as By-Product	157
NUCLEIC ACIDS AND THEIR SUBSTITUENTS	160
Guanosine	160
Mutants Resistant to Psicofuranine or Decoyinine	160
Mutants Resistant to Sulfa Drugs	161
Mutants Resistant to Methionine or Azaserine	161
(2'-Amino-2'-Deoxypentofuranosyl)Guanine	162
Various Nucleosides	163
Inosine	163
Double Salts of S-Adenosyl-L-Methionine	164
S-Adenosylmethionine and Methylthioadenosine	168
Nucleoside Cyclic Phosphates from RNA	169

Contents and Subject Index

1- β -D-Ribofuranosyl-1,2,4-Triazole-3-Carboxamide	170
4-Carbamoyl-1- β -D-Ribofuranosylimidazolium-5-olate	172
Various Nucleotides	174
Cyclic-3',5'-Cytidylic Acid	174
Inosinic Acid	176
5'-Guanylic Acid	177
3',5'-Cyclic Adenylic Acid	178
Nucleotide Bases	180
4-Thiouracil	180
Nucleic Acids	182
Production by Fermentation	182
ALCOHOLS	185
Ethanol	185
Production from Cellulose in One-Step Process	185
Thermophilic Mixed Culture	188
Other Alcohols	190
D-Mannitol from D-Glucose	190
4-Aminobenzyl Alcohol Derivatives	192
Sterols	195
Ergosterol and Its Esters	195
Cholesterol	197
CARBOHYDRATES	199
Dextrose	199
Mixed Immobilized Enzymes	199
Production from Protein-Containing Starch	201
Production from Granular Starch	203
Fructose or Levulose	204
Levulose from Granular Starch	204
Isomerization of Glucose with Bound Glucose Isomerase	205
Isomerization of Glucose Under Oxygen-Limiting Conditions	207
Treatment of Cellular Material Containing Glucose Isomerase	209
Carrier for Glucose Isomerase	210
Continuous Isomerization of Dextrose	211
Removal of Heavy Metal Ions	213
Fatty Acid Esters of Fructose	216
Other Monosaccharides	217
Galactose	217
D-Ribose	222
L-Sorbose	224
Maltose	225
Production from Starch Using a <i>Streptomyces</i> Amylase	225
Use of β -Amylase	227
Use of α -1,6-Glucosidase	229
Two-Enzyme Process	230
Sucrose	231
Production Using α -Galactosidase-Producing Molds	231
Amylose	235
Porous Amylose Powder	235
Nitrogen-Containing Amylose Derivatives	237
Glucan	238
Water-Insoluble Glucan	238

β -1,3-Glucan Derivatives	239
Maltopentaose	241
Production from Amylose	241
Production Using <i>Streptomyces myxogenes</i>	243
Pullulan	244
Production from Saccharides	244
Method of Purification	245
Starches	246
Production of Starch Hydrolysates	246
Lipophilic Starch Derivatives	248
Various Polysaccharides	250
Production from Glucides Using Ammonium Phosphate	250
Production Under Carbon-Limiting Conditions	251
Production Under Phosphate-Limiting Conditions	253
Heteropolysaccharide from Fermentation of Methanol	254
Alkali Metal Glycerophosphate in Methanol-Containing Medium	255
Emulsifying Agent	256
Nonfibrous Polysaccharides	257
Addition of Sodium Hydroxide to <i>Xanthomonas</i> Culture	258
Monokaryotic Mycelium of <i>Coriolus versicolor</i> as Polysaccharides	
Source	259
Gel-Forming Polysaccharide from <i>Arthrobacter carbazolum</i>	261
Heteropolysaccharide from <i>Erwinia tahitica</i>	263
Production from <i>Azobacter indicus</i>	264
Cyclodextrin	266
Miscellaneous Carbohydrates	267
Soluble Flavonoid Glycosides	267
VITAMINS	269
2-Keto-L-Gulonic Acid	269
Production from L-Sorbose	269
Production from 2,5-Diketo-D-Gluconic Acid	271
Production from D-Glucose	273
Production from L-Gulonic Acid	274
Vitamin B ₁₂	276
Production from Arthrobacter Strain	276
Synchronization of Bacteria Population	278
Control of Nitrogen/Carbon Ratio	280

Sodium Citrate Dihydrate	316
Ergot Alkaloids	317
2,6-Diaminopyrimidines	318
7-Amino-Cephem Compounds	319
Macrocyclic Ketones	320
Water-Soluble Polymers	324
Dihydroxyacetone	324
Fermentation Products of 8-Chloro-10,11-Dihydrodibenz[b,f] [1,4]-Oxazepine	325
4-Androstene-3,17-Dione Derivatives	327
Androstan-3,17-Dione Derivatives	329
Spray Drying of Alkali Metal Gluconates	330
Allylic Methylhydroxylated Novobiocins	331
Hydroxylated Biphenyl Compounds	333
Epoxides	334
OTHER MICROBIAL PROCESSES	337
Epoxidation of Linear Hydrocarbons	337
Recycling of Microorganisms	339
Degradation of Hydroxystyrene Polymers	341
Biomass Growth Restriction	343
Control of Limiting Nutrient	346
Hydroxylation of 2,6-Methano-3-Benzazocines	348
Aerobic Cultivation of Microorganisms	350
Blood Control Standard	351
ϵ -Caprolactam-Utilizing Microorganism	353
Production of Yeast Cells	354
Microorganism Immobilization in a Hydrophilic Gel	355
Hydrous Metal Oxide-Chelated Polyhydroxy Support	358
Mercury Extraction	359
Silver Recovery by Photosynthetic Sulfur Bacteria	361
Silver Recovery by Chemosynthetic Sulfur Bacteria	364
ENZYMES AND ENZYMATIC PROCESSES	365
Enzymes	365
α -Amylase Active in Alkaline Conditions	365
Lipase and Pyocyanine from n-Paraffins	366
α -Galactosidase	367
Other Processes	368
Oxidation of Hydrocarbons	368
Hydrolysis of Triglycerides	371
Gelatin Extraction	373
Recovery of Silver from Photographic Wastes	373
COMPANY INDEX	376
INVENTOR INDEX	378
U.S. PATENT NUMBER INDEX	384

INTRODUCTION

Fermentation processes can probably rank as man's first attempt at controlling chemical reactions to produce useful products. Although the mechanisms involved were not understood until relatively modern times (indeed the role of microorganisms was not even recognized until the work of Pasteur), the benefits derived from microbial processes have been widespread through the ages, notably in the wine-making and brewing industries.

With the increasing sophistication and progress of the chemical industry, man is turning more and more to the use of microorganisms to produce an ever-growing list of chemical products. Utilizing microbes and their enzymes, reactions can be carried out with a speed and efficiency that could not be attained in their absence, if in fact the reaction could be accomplished at all.

Progress in developing new microbial processes has proceeded along a number of pathways. A better understanding of the mechanisms involved, new strains of microorganisms, and easier identification and separation of the desired product are only a few ways in which techniques have improved in the last years.

The food industry has probably been the major recipient of recent advances in this field. Amino acid and protein supplementation has been the focus of much attention, and the large number of patents on this subject attest to this fact. New strains of microorganisms have been developed by chemical and physical mutations of the parent strains which produce these substances in higher yield and more efficiently than was heretofore possible.

The large number of processes to produce a wide variety of carbohydrates, from simple sugars to the high molecular weight polysaccharides, also reflect the desire of the industry to use to advantage the wide spectrum of microorganisms available, mainly through isomerization techniques to convert one form of sugar to another, or the use of enzymes to break down polysaccharides and starches to their components.
