Acknowledgments

This book grew out of an earlier collaboration project with Dr. M. Kurzynski. I am very thankful to Dr. Kurzynski for his many insights.

The author also wishes to thank his students, staff and collaborators for their immense help in various stages of work leading to this book. In particular, the assistance of the following individuals is gratefully acknowledged: Eric Carpenter, Torin Huzil, Tyler Luchko, Hannes Bolterauer, John Dixon, Eberhard Unger, and Avner Priel.

Special thanks are expressed for Michelle Hanlon's tireless work on editing this book and organizing book material.

List of Tables

1.1	Pattern Recognition in Networks	14
1.2	Amino Acid Sequences in Horse and Human Proteins	56
2.1	Properties of Biologically Important Bonds	76
2.2	Potential Energies and Bond Distance	83
2.3	Relative Ionization	85
2.4	Electronic Distribution	85
2.5	Electron Distribution for Biological Atoms	86
2.6	Data for Different Types of Bonds	87
2.7	The Coefficient A for Different Molecules	91
2.8	Empirical Values of Coefficients A and B	92
2.9	Van der Waals Radii	92
2.10	Bond Lengths for Various Bond Types	94
2.11	Properties of Various $R - H_n$ Compounds	95
2.12	The Structure of Water in Liquid and Ice Form	98
2.13	Size of Cluster at Different Temperatures	98
2.14	Change in Thermodynamic Parameters with Introduction of an Organic Molecule into Water	99
2.15	Number of Hydrogen Bonds for a Water Molecule	100
2.16	The Twenty Naturally Occurring Amino Acids	107
2.17	Energy Contributions to Native State Stabilization	121
2.18	The Genetic Code	135
3.1	Major Components of Cytoplasm [167] in a Typical Mammalian Cell	151
3.2	Percentage Content and Molecular Numbers of Key Cellular Components	152
3.3	The Key Biomolecular Polymers in a Cell	157
3.4	The Amino Acid Sequence of human α_1 - and β_1 - tubulin . . .	160
3.5	Localization and Homology of Bovine β -Tubulin [200]	161
3.6	Summary of Actin-Binding Proteins	171
3.7	Tissue Distribution of β Tubulin Isoforms in Normal Cells . .	175
3.8	Experimental Data for Elastic Properties of MTs (and Other Proteins) from the Literature	190
3.9	Tension Forces Within the Cell	203
3.10	Concentration Ratios for Cellular Membranes and the Corre- sponding Nernst Potential in Equation	233

3.11	A Probable Cycle of Actomyosin Motion	245
3.12	Fits of Single or Double Gaussian Profiles to the Histograms in Fig. 3.58 (5 μ M tilting/non-tilting and 0 ATP)	249
3.13	Key Electrostatic Properties of Tubulin	273
3.14	Concentration Data	282
3.15	Data for Problem 3.18	286
4.1	Diffusion Constants at Room Temperature in Water	315
4.2	Potential Functions of Molecular Complexes as Bioelectronic Materials	331
4.3	Calculated Conductivity and Resistance of a 1-micron Polymer Composed of Tubulin Dimers	368
4.4	A Summary of Characteristic Time Estimates	402
4.5	A List of Key Chemical Reactions Involved in Microtubule As- sembly	436
4.6	Typical Parameter Values for Microtubule Assembly Following [278]	437
4.7	Data for Problem 4.14	464

List of Figures

1.1	Hierarchical organization of science.	4
1.2	General animal cell during interphase.	6
1.3	Comparison of structures of typical animal and plant cells. . .	8
1.4	Processing genetic information.	25
1.5	Amphiphilic molecules.	27
1.6	Development of the prokaryotic cell machinery.	29
1.7	Outline of the main metabolic pathways.	30
1.8	The structure of a bacterial cell.	33
1.9	Proton pumps.	34
1.10	Porphyrin ring.	35
1.11	A proton pump in purple bacteria.	36
1.12	The utilization of solar energy by green sulfur bacteria. . . .	38
1.13	A proton pump using solar energy in the case of cyanobacteria.	39
1.14	Protein pump of heterotrophic aerobic bacteria.	40
1.15	A simplified phylogenetic tree of living organisms on Earth. .	41
1.16	Compartments of the eukaryotic cell.	44
1.17	Additional organelles of the plant cell.	45
2.1	Examples of the three most important kinds of carboxylic acids with purely carbohydrate substituents.	62
2.2	Examples of the three most important kinds of alcohols with a purely carbohydrate substituent.	62
2.3	Three examples of monosaccharides.	63
2.4	Most important examples of heterocycles.	64
2.5	Some organic compounds with two functional groups.	65
2.6	Formation of the ester bond.	66
2.7	Formation of lipid (a) and phospholipid (b).	66
2.8	Example of a nucleotide, AMP.	67
2.9	Formation of ATP from AMP	68
2.10	Polysaccharides.	70
2.11	Spatial distribution of the electron probability density. . . .	71
2.12	The spatial structure of methane, ammonia and water	72
2.13	The spatial structures of ethane, methylamine and methanol.	73
2.14	Properties related to the rotation of a single covalent bond. .	74
2.15	Conformational states.	75
2.16	Two enantiomers of glyceraldehyde.	76

2.17 Bonds formed by electron orbitals in the process of trigonal hybridization sp^2	77
2.18 Configurational isomers.	78
2.19 Delocalization of double bonds.	79
2.20 Work to bring two charges together from infinity	81
2.21 Potential energy curve for two equally charged ions close to each other.	82
2.22 Net potential energy for NaCl.	82
2.23 Dipole due to two opposite charges.	87
2.24 Dipole interacting with a charge q_1	88
2.25 Interaction of two permanent dipoles.	89
2.26 Induced dipole moment.	90
2.27 The Lennard-Jones potential.	91
2.28 Dimerization of formic acid.	93
2.29 Hydration of H_2O by H_2O : hydrogen bond.	94
2.30 System of hydrogen bonds in water.	97
2.31 The structure of water in liquid and ice form.	97
2.32 Water molecule with four H bonds and one hydrophobic pocket.	100
2.33 Structures created by amphipathic molecules in water.	102
2.34 Phase diagram of amphipathic molecule-water system	103
2.35 Liquid crystalline phases of the amphipathic molecule-water system	104
2.36 Side chains of 20 canonical amino acids	106
2.37 The four substituents connected to C^α	108
2.38 Naturally-occurring and synthetically-produced amino acids.	108
2.39 A polypeptide chain.	111
2.40 Chemical structure of a protein.	114
2.41 Sterically allowed regions for angles ϕ and ψ	116
2.42 The structure of an α -helix (a) and an antiparallel β -pleated sheet.	117
2.43 A schematic comparison between a solid and a protein.	121
2.44 A heteropolymer model composed of two residue types, hydrophobic and hydrophilic, in a "poor" solvent.	122
2.45 The percentage of native-like character as temperature rises.	123
2.46 Notation of angles in nucleic acids.	129
2.47 Canonical nitrogenous bases and Watson-Crick pairing.	130
2.48 Each gene contains the information necessary to produce a specific protein.	131
2.49 DNA double helix.	132
2.50 The replication of DNA.	133
2.51 Defects found in irradiated DNA.	136
2.52 Quantization of vibration energy levels.	137
2.53 Quantum mechanical origin of fluorescence.	138
2.54 Singlet and triplet states.	139
2.55 Quantum mechanical origin of phosphorescence.	139

3.1	Solute molecules inside and outside of a cell.	153
3.2	Cytoskeletal components of intestinal epithelial cells.	156
3.3	A diagram of the tubulin molecule.	158
3.4	A map of the electrostatic charge distribution on an alpha-tubulin monomer microtubule	159
3.5	The 13A and 13B MT lattices	163
3.6	Microfilaments with fluorescent label.	167
3.7	Structure of the G-actin monomer.	168
3.8	Formation of the F-actin polymer.	168
3.9	The double stranded helix of an actin filament	169
3.10	The three main arrangements of microfilament aggregation	170
3.11	Schematic of an intermediate filament	172
3.12	Comparison between the α tubulin's solvent accessible surface areas and their estimated dipole moment magnitudes.	177
3.13	Comparison between the β tubulin's solvent accessible surface areas and their estimated dipole moment magnitudes.	178
3.14	Comparison between the α tubulin's dipole moments and their net monomer charges.	179
3.15	Comparison between the β tubulin's dipole moments and their net monomer charges.	179
3.16	A histogram of dipole moment magnitudes estimated for α tubulin sequences. The two magnitudes resulting from the use of two models have been averaged, and this mean value sorted.	180
3.17	A histogram of dipole moment magnitudes estimated for β tubulin sequences. The three magnitudes from the three models has been averaged, and this mean sorted.	180
3.18	The nine coefficients c_i as functions of the displacement, d	182
3.19	The per dimer interaction energies with an adjacent protofilament in a microtubule.	183
3.20	The per dimer interaction energy within a microtubule protofilament.	184
3.21	A motor protein is shown 'walking' along a MT protofilament.	185
3.22	MT protofilament. α and β monomers are colored gray and white respectively.	191
3.23	A cubic lattice of particles	192
3.24	Different types of forces applied to a cylinder and resulting deformations	193
3.25	<i>a)</i> Side elevation of an MT showing the area in grey to which the force F is applied. <i>b)</i> Cross-section of an MT showing the direction of the applied force.	195
3.26	<i>a)</i> Section of an MT of length L , subjected to a lateral shearing force, F . <i>b)</i> Movement of a single dimer as a result of the force F indicating the undisturbed position (before, B') and the position following displacement (after, A').	196
3.27	The structure of a centriole.	198

3.28	Comparison between the structure of a cilium (above) and a centriole (below)	198
3.29	A schematic cross-section through a flagellum (a), and the microtubule (MT) doublet (b)	199
3.30	Schematic representation of a longitudinal section of a cilium.	200
3.31	Different stages during the beating of a cilium (a). The oscillations of Ca^{2+} in the transition zone (b).	200
3.32	An electron micrograph of a cross-section of a cilium following <i>Molecular Cell Biology</i> by Lodish et al. [195].	201
3.33	A diagram showing the mitochondrial membrane and its electrical equivalent.	207
3.34	The three key types of ion channels.	211
3.35	The functioning of a gate: modulation of a local electric field by an ion channel.	211
3.36	Equivalent electrical circuit of an ion channel.	211
3.37	(a) The percentage of cells that removed the light scattering particle as a function of wavelength. (b) Spectral sensitivity of destabilisation versus wavelength in nm.	214
3.38	A model of the transducing components located on the inner side of the mitochondrial membrane.	215
3.39	A schematic diagram of cytochrome c oxidase (cyt.aa3). . . .	215
3.40	A view from the mitochondria intermembrane space down the membrane normal	217
3.41	Basic structure of the heme group.	218
3.42	Excitation of Fe^{+2} , transfer of an electron to a proton and subsequent descent in energy from the $n=6$ to $n=3$ state of hydrogen	222
3.43	The passage of a proton through an opening in the mitochondrial wall ferrying an electron between donor and acceptor sites.	223
3.44	A simple representation of a phospholipid with the globular head group structure representing the hydrophilic (or water loving) section of the phospholipid.	226
3.45	Schematic of a typical cellular membrane.	226
3.46	Membrane phase transitions.	227
3.47	Schematic of a semi-permeable membrane.	229
3.48	Ion concentrations outside and inside a cell.	232
3.49	Membrane dipole dynamics.	233
3.50	Some of the key vibrational modes of the membranes molecular groups.	234
3.51	Vesicles are shown schematically to be attached to MAPs that move along the microtubule conveyer belt by a kinesin motor.	235
3.52	Scheme relating conformational changes at several stages . . .	237
3.53	Actin-myosin complex in muscles.	238
3.54	A kinesin molecule moves a microtubule along a glass surface.	240
3.55	Crystal structure of the motor domain.	240

3.56	The actomyosin ATPase cycle.	244
3.57	Interpretation of the left-handed rotation.	247
3.58	Distributions of average β -values in the presence and absence of ATP.	248
3.59	Histogram of measured separations between the myosin VI heads and three Gaussian fits to the data.	251
3.60	Hand-over-hand mechanism of walking.	252
3.61	A sketch of a KN molecule with cargo moving along a MT.	253
3.62	Crystal structure of the KN motor domain (based on Kikkawa et al. [170], Koradi et al. [177]).	254
3.63	Human being with two identical (right) hands	263
3.64	The mechano-chemical cycle for the plus-directed two-headed KN.	265
3.65	A sketch of the potential energy barrier assumed in the model.	266
3.66	The interaction inside the KN molecule	267
3.67	Schematic representation of the structure of a microtubule	272
3.68	Various forms of tubulin assemblies	274
3.69	A microtubule structure showing the constituent dipoles.	276
3.70	Conformational “kink” traveling along a MT.	277
3.71	A schematic representation of water molecules bound to the surface of a protein.	277
3.72	Schematic representation of the gating mechanism	280
4.1	The chemical structure of ATP.	310
4.2	A schematic diagram of the functioning of the ATPase.	312
4.3	An illustration of the diffusion process due to a concentration gradient in a cylindrical container.	314
4.4	An illustration of the process of osmosis.	316
4.5	Reverse osmosis occurs when a pressure greater than the osmotic pressure is applied.	318
4.6	A schematic illustration of a membrane with pores.	319
4.7	The concentration profile across a membrane.	320
4.8	Sketch of two compartments separated by a membrane.	321
4.9	Plot of $C(t)$	322
4.10	Diagram showing the concentration distribution in space at the beginning of the diffusion process.	323
4.11	Concentration profiles as a function of the spherical radius for both $Q > 0$ (left panel) and $Q < 0$ (right panel).	324
4.12	A graphical comparison of data, obtained in the study of oxygen consumption in Arbacia eggs and bacteria, to the theoretical prediction in Eq. (4.45).	326
4.13	Diagrams of oxygen consumption versus oxygen concentration for the cells of Arbacia Eggs (left panel) and luminous bacteria (right panel).	328

4.14	Schematic representation of protonic conduction in chain-like and ring-like organic polymers.	330
4.15	Dimer rings.	330
4.16	Faults in the hydrogen bond system.	330
4.17	Proton migration in hydrogen bonded chains.	331
4.18	Total amide - I energy (summed over all three spines of the α helix) as a function of χ	334
4.19	Two prominent examples of nerve cells.	337
4.20	A one-dimensional chain of quantum wells representing the energy profile along a MT protofilament where the α and β monomers have alternating site energies.	348
4.21	Variation of the bound state energies with the depth of the double quantum wells, $f_1 = f_2$. The straight line indicates where the bound state energy is equal to the well depth. . .	350
4.22	Energy of the itinerant states as a function of U/t with the energy plotted in units of $2t$	352
4.23	Optical conductivity of the two dimer system with two, three and four electrons.	356
4.24	(a) Optical conductivity of the three-dimer system from two electrons through half filling. (b) Integrated optical conductivity of the three-dimer system shows that indeed the protofilament is an insulator. The gap for excitation of the half-filled polymer is seen easily here.	357
4.25	Optical conductivity spectrum variation with the broadening parameter.	358
4.26	The variation of the optical conductivity spectrum with temperature is shown.	358
4.27	Threshold to conduction as a function of protofilament length.	359
4.28	Kinetic energy per electron as a function of system size.	360
4.29	Lattice unit cells for conductivity calculations. The unit cell on the left corresponds to the MT A lattice while that on the right corresponds to the MT B lattice.	361
4.30	(a) Optical conductivity along the protofilament axis of the tubulin sheet consisting of a 14-site lattice with two electrons while $t_r = 0$ and t_l is varied. (b) Integrated conductivity of the tubulin sheet with two electrons while $t_r = 0$ and t_l is varied.	362
4.31	(a) Optical conductivity along the protofilament axis of the unwrapped 14-site lattice with two electrons while $t_l = 0.4$ and t_r is varied. (b) Integrated conductivity of the unwrapped 14-site lattice with two electrons while $t_l = 0.4$ and t_r is varied.	364
4.32	(a) Optical conductivity along the protofilament direction of the 14-site MT B lattice with two electrons. (b) Integrated conductivity of the 14-site MT B with two electrons shows a non-zero weight for finite t_l	365

4.33	(a) Optical conductivity along the protofilament direction of the 14-site MT A lattice with two electrons. (b) Integrated conductivity of the 14-site MT A lattice with two electrons shows a non-zero Drude weight for finite t_1	366
4.34	An equivalent electrical circuit for a segment of an actin filament.	372
4.35	Examples of the conformational states of the C-termini in a tubulin dimer (right) and results from bead-spring model simulations (left).	375
4.36	An illustration of a MT C-terminus conformational change transfer process. Ionic waves travel along an adjacent MAP via local perturbations to the bounded counter-ions.	376
4.37	Propagation of a localized perturbation applied to counter-ions near the binding site of a MAP2.	376
4.38	Schematic representation of the experimental set-up used for the measurements of MT's ionic conductivity.	377
4.39	A scheme of the dendritic shaft	379
4.40	An arrangement of molecules (a) and extended dipoles (b) in the extended dipole calculation.	392
4.41	Dispersion relations for the exciton energy in the Scheibe aggregate.	392
4.42	An illustration of the process of the creation of a coherent exciton domain by a photon; following [27].	394
4.43	The three regimes of behaviour for one-dimensional exciton-phonon systems; following [22].	400
4.44	Irreversible process of carbon monoxide binding to myoglobin.	404
4.45	A schematic "telegraphic noise" recorded with the help of the patch clamp technique.	405
4.46	Schematic spectra of the reciprocal relaxation times of conformational transition dynamics within the native state of protein.	406
4.47	An example of a one-dimensional potential with a hierarchy of barrier heights.	407
4.48	A schematic cross-section of the fundamental structural unit of each protein, a domain.	408
4.49	Coupling of two phosphorylation reactions through a common reagent P_i (a) and through a kinase enzyme E (b).	409
4.50	Two different chemical reactions proceeding independently from each other.	412
4.51	(a) Maxwell's demon. (b) Feynman's version of Maxwell's demon.	414
4.52	The general scheme of a chemo-chemical machine coupling two reactions	416
4.53	The four possible kinetic schemes for the system of two coupled reactions	417
4.54	Simplified kinetic cycles of the calcium pump	418

4.55	Simplified Lymn-Taylor-Eisenberg kinetic scheme	419
4.56	The functioning of biological molecular machines on a thermodynamic scale	419
4.57	The triceps and biceps muscles in the human arm.	420
4.58	The forefinger. Note that the tendons carrying the forces exerted by the muscles go over joints that change the direction of the force.	421
4.59	Counteracting muscle pairs in the arm and the leg.	422
4.60	Principle of simultaneous action of muscles.	423
4.61	Force-velocity curve.	425
4.62	The composition of muscle fibers. Fibers (b) consist of fibrils which have light and dark bands (d). Myosin and actin filaments are designated (e) and (f).	427
4.63	The principal components of the motor protein complex. . . .	427
4.64	The growth of a single microtubule is erratic. Slow, steady growth is interrupted by large catastrophe events at about 8 s and 46 s while a rescue event occurs between two catastrophe events at about 26 s.	431
4.65	The global conformational change that occurs between assembly and disassembly phases is illustrated. The once straight protofilaments become curved after the individual tubulin subunits undergo a structural change.	434
4.66	Dependence of the number average length (L_n) of actin filaments on the purity and monomer concentration during polymerization.	450
4.67	The eukaryotic cell cycle.	453
4.68	Stages of mitosis.	454
4.69	Disruption of the cytoskeletal organization by various chemical agents at different stages of the cell cycle.	458
4.70	Specialization of MTs. (a) Astral, (b) Polar, (c) Kinetochore. .	458
4.71	Development of a cleavage in the simulations by Alt and Dembo [10].	459
4.72	Graphs for tubulin polymerized in vitro for (a) an initial solution of pure tubulin; (b) an initial solution of tubulin and seeds. C_{av} is the average concentration of tubulin in cells (10–20 μM).	462
