Preface to Third edition

SINCE the first edition of this book in 1970 there has been increasing interest in the problems that are raised for many different disciplines in an attempt to understand the physiology of bone. The present volume is intended for readers who want a bird's-eye view of the subject and directions as to where they can find more detailed information on particular aspects. It does not attempt to give a complete account or even a full bibliography of the many exciting and often controversial questions that are covered by specialist journals and monographs. It can only hope to provide some signposts to both the past and the present, and perhaps the future.

Preface to Second edition

CERTAIN aspects of the physiology of bone have advanced with amazing rapidity since the first edition of the book with this title appeared in 1970. This is particularly true of our understanding, still incomplete, of the behaviour of vitamin D and of the complicated story of the effects of parathyroid hormone and calcitonin on calcium homeostasis. An attempt is now made to bring our knowledge of the physiology of bone up-to-date without increasing the length of the book. This has necessitated a complete rewriting of some sections though others are little changed. The bibliography represents an attempt to include mainly references to papers and monographs that have appeared since 1969. On the other hand, mention is made of classical papers of an earlier date and in some cases knowledge is dependent on older work entirely. Again I must apologize to authors who have received inadequate mention. The bibliography is personal rather than complete.

It is hoped that this new edition will be useful to both medical students and their teachers.

Preface to First edition

THE skeleton, for purposes of the present monograph, is taken to include both bone and the cartilage closely related to bone. The teeth are excluded. The anatomical structure and the supporting function of the skeleton is not discussed in any detail, nor is the haemopoietic marrow, a tissue which in some ways it is difficult to dissociate from consideration of bone. Emphasis is laid rather on the complex mechanisms involved in enabling the skeleton to play its essential role in mineral homeostasis.

Attention is given to the most recent work available, particularly that in journals and symposia. The bibliography does not attempt to be comprehensive. Certain questions are discussed at greater length than others for the reason that at the moment they are arousing lively interest and therefore new knowledge is available. No attempt is made to replace standard works such as *Mineral metabolism: an advanced treatise*, by Comar and Bronner, or *The biochemistry and physiology of bone*, edited by Bourne. It is certainly presumptuous for one individual to attempt to survey a field which today occupies the attention of specialists from many different disciplines. However, it is hoped that a bird's-eye view of an exciting and expanding subject may be of use to medical students and their teachers.

Acknowledgements

I AM grateful to many people who have helped me in different ways in preparing this edition. My special thanks must go to John Loutit for exciting discussions and for having read the whole manuscript. I am also much indebted to Dr G. E. Harrison for his advice and help over Chapter 8. Once again I must take sole responsibility for the pattern of the book, the views expressed, and for the omission of many important references.

Thanks are due to the editors and publishers of the following journals, symposia, and books for permission to use new figures and tables. I regret that in two cases no permission has been obtained as I have not been able to trace the origin of the picture, which I had in my files: Fig. 2.3 and Fig. 1.14. *The biochemistry and physiology of bone* (2nd edn), Academic Press; *Histopathology of cartilage, bone and joints*, J. B. Lippincott Company; *Human growth*, Cassell Ltd; *Nature* (London); *Calcified tissue Research*; *Annals of Human Biology*; *The New England Journal of Medicine*, Pergamon Press; *The Journal of Cell Biology*; *Proceedings of the Royal Society*; *Professional and Scientific Publications*, Springer Verlag.

I am also grateful to my photographer, Richard McAvoy, for his careful work. This revised edition has only been made possible because of the devoted work and patience of my secretary, Janet Judge.

Contents

1. Bone as a tissue	1
1. DEVELOPMENT	1
1.1. Intramembranous ossification	1
1.2. Endochondral ossification	2
2. STRUCTURE	6
2.1. Woven bone	7
2.2. Trabecular bone	7
2.3. Compact cortical bone	7
3. BONE SURFACES	9
3.1. Bone cells	10
3.1.2. <i>Does a membrane exist separating bone fluid from extravascular fluid?</i>	14
3.2. Bone fluid	14
3.2.1. <i>Mineral content</i>	15
3.2.2. <i>Protein content</i>	15
3.3. Osteoid matrix	15
3.4. Mineralized matrix	17
4. PATTERNS OF GROWTH	17
4.1. Endochondral ossification	17
4.2. Apposition	19
5. THE BLOOD SUPPLY OF BONE	19
5.1. The afferent vascular system	19
5.1.1. <i>The nutrient artery</i>	19
5.1.2. <i>The metaphyseal and epiphyseal vessels</i>	20
5.1.3. <i>The periosteal vessels</i>	20
5.2. The efferent vascular system	20
6. THE HAEMODYNAMICS OF BONE CIRCULATION	20
7. THE LYMPHATICS OF BONE	22
8. FUNCTION	22
8.1. Skeletal homeostasis	22
8.1.1. <i>Hormonal control</i>	23
8.1.2. <i>Mechanical stress and pressure</i>	23
8.1.3. <i>Piezoelectricity</i>	23
8.2. Mineral homeostasis	24
8.3. Bone – Bone marrow interaction	25

2. Cellular elements of the skeleton	27
1. THE OSTEOLAST	27
1.1. Evidence for stromal origin	27
1.1.1. <i>Embryological</i>	27
1.1.2. <i>Morphological</i>	28
1.1.3. <i>Experimental</i>	28
1.2. Morphology	29
1.2.1. <i>Osteoblasts of actively growing bone</i>	29
1.2.2. <i>Osteoblasts of mature bone</i>	33
1.3. Function	34
1.3.1. <i>Synthesis of collagen</i>	34
1.3.2. <i>Synthesis of carbohydrate protein complexes</i>	36
1.3.3. <i>Calcification process</i>	37
1.3.4. <i>Maintenance of mineral homeostasis</i>	38
1.4. Factors affecting osteoblast behaviour	38
2. THE OSTEOCYTE	39
2.1. Origin and subsequent fate	39
2.2. Morphology	39
2.3. Function	40
2.3.1. <i>Maintenance of bone matrix</i>	41
2.3.2. <i>Matrix formation</i>	41
2.3.3. <i>Mineral homeostasis</i>	41
2.3.4. <i>Alkaline earth long-term exchange</i>	42
2.3.5. <i>Osteolysis</i>	42
2.4. Factors affecting osteocyte behaviour	43
3. THE OSTEOLAST AND MONONUCLEAR CELLS THAT RESORB BONE	43
3.1. The classical osteoclast	44
3.1.1. <i>Morphology</i>	44
3.1.2. <i>Origin</i>	45
3.1.3. <i>Function</i>	49
3.1.4. <i>Factors affecting osteoclast behaviour</i>	50
3.2. Mononuclear cells	50
3.3. The fibroblast	51
4. AGENTS OTHER THAN CELLS AND HORMONES ASSOCIATED WITH BONE RESORPTION	51
4.1. Osteoclast stimulating or activating factor	51
4.2. Prostaglandins	51
5. OSTEOPETROSIS AND RESORPTION	52
6. THE FIBROBLAST	53
7. BONE-INDUCING SUBSTANCES	54

3. Chemistry of bone matrix	56
1. GENERAL CHEMISTRY OF BONE AND CARTILAGE	56
2. COLLAGEN	57
2.1. General structure of the molecule	59
2.2. Types of collagen in man	62
2.3. Synthesis of Type I and Type II collagen	62
2.4. Intracellular processing of pro-alpha chains	66
2.5. Extracellular processing	66
2.6. Collagen abnormalities	67
2.6.1. Genetic abnormalities	67
2.6.2. Transitory diseases	68
3. NON-COLLAGENOUS CONSTITUENTS OF MATRIX	69
3.1. The carbohydrate protein complexes	69
3.1.1. The protein-polysaccharides (or proteoglycans)	70
3.1.2. Glycoproteins	70
3.2. Peptides	78
3.3. Lipids	78
4. Cartilage	81
1. TYPES OF CARTILAGE	81
1.1. Hyaline cartilage	81
1.2. Elastic cartilage	81
1.3. Fibrous cartilage	82
1.4. Intermediate tissue	82
2. CARTILAGE CELLS	82
2.1. Origin	82
2.2. The chondrocyte	83
2.3. The chondroclast	83
3. CARTILAGE MATRIX	84
3.1. Collagen	84
3.2. Proteoglycans of cartilage	84
4. EPIPHYSEAL CARTILAGE AND ITS RELATION TO CALCIFICATION	85
5. ARTICULAR CARTILAGE	88
5.1. Hyaline articular cartilage	89
5.1.1. The cells	89
5.1.2. The matrix	89
5.1.3. Nutrition	90
5.2. Fibrous articular cartilage	90
6. TISSUE INTERMEDIATE BETWEEN BONE AND CARTILAGE	91

5. Chemistry of bone mineral

1. CHEMICAL CHARACTER	92
1.1. Hydroxyapatite crystal	92
1.2. Amorphous calcium phosphate	94
1.3. Changes induced by chronic renal disease	95
2. INORGANIC CONSTITUENTS OTHER THAN HYDROXYAPATITE AND AMORPHOUS CALCIUM PHOSPHATE	96
2.1. Fluoride	96
2.2. Sodium	97
2.3. Potassium	97
2.4. Magnesium	97
2.5. Strontium	97
2.6. Radium and other α -emitters	100
2.7. Trace elements	100
2.7.1. Lead	101
2.7.2. Zinc	101
2.8. Citrate	101

6. The mechanism of calcification

1. RAISING THE $(\text{Ca}^{2+}) \times (\text{PO}_4^{2-})$ SOLUTION ION PRODUCT	103
1.1. Alkaline phosphatase and other enzymes	103
1.2. Calcium binding and other glycoproteins	104
2. NUCLEATING SITES	104
2.1. Collagen	104
2.2. The glycoproteins of bone	105
2.3. Matrix vesicles	106
2.3.1. Calcium storage	107
3. SUBSTANCES PREVENTING CALCIFICATION	108
3.1. Magnesium in matrix vesicles	108
3.2. The proteoglycans in cartilage	108
3.3. A specific inhibitor in cartilage	108
3.4. Pyrophosphates	108
4. THE DIPHOSPHONATES	109
4.1. Clinical use	110
4.1.1. Paget's disease of bone	110
4.1.2. Osteolytic bone disease	111
4.1.3. Ectopic calcification	111
4.1.4. Osteoporosis	111
4.1.5. Bone scanning	112
4.2. Fluoride	112

7. Calcium, magnesium, and phosphorus in plasma and urine	113
1. CALCIUM	113
1.1. Plasma (serum) levels	114
1.2. Cell calcium and cyclic AMP	115
1.3. Absorption from the gut	115
1.4. Excretion of calcium	116
1.4.1. <i>The intestine</i>	116
1.4.2. <i>The urine</i>	117
1.4.3. <i>Sweat</i>	118
2. MAGNESIUM	118
2.1. Plasma level	119
2.2. Absorption from the gut	119
2.3. Excretion	119
2.3.1. <i>Kidney</i>	119
2.3.2. <i>Sweat</i>	120
2.4. Magnesium deficiency	120
3. PHOSPHATE	121
3.1. Intake	122
3.2. Plasma levels	122
3.3. Absorption from the gut	122
3.4. Excretion by the kidney	123
3.5. Factors affecting renal reabsorption in kidney	124
8. The movement of ions in and out of the skeleton	125
1. THE OVERALL PATTERN OF MOVEMENT OF IONS	125
1.1. Use of radioactive tracers	126
1.2. Behaviour of the alkaline earths	127
1.3. Variability in different bones	133
1.4. Strontium	135
1.5. Radium	135
1.6. Barium	136
2. THE PART PLAYED BY OSTEOGENIC CELLS IN THE MOVEMENT OF IONS	136
2.1. Acute response to changes in plasma Ca^{2+}	138
2.2. Chronic response to disturbance of plasma Ca^{2+}	138
9. Biological factors in mineral homeostasis	139
1. VITAMIN D	139
1.1. Chemistry	139
1.2. Regulation of vitamin D metabolism	142
1.2.1. <i>The effects of PTH</i>	143
1.2.2. <i>The effects of phosphate</i>	143

1.2.3.	<i>Autoregulation of $1,25-(OH)_2D_3$</i>	143
1.2.4.	<i>Other hormones</i>	144
1.2.5.	<i>Sex hormones</i>	144
1.3.	Biological effects	144
1.3.1.	<i>Intestinal absorption</i>	144
1.3.2.	<i>Kidney</i>	146

1. Bone as a Tissue

BONE is a highly specialized form of connective tissue. It is distinguished from other forms of connective tissue by the fact that it is extremely hard, owing to the deposition within a relatively soft organic matrix of a complex mineral substance, largely composed of calcium, phosphate, and carbonate.

1. DEVELOPMENT

Bone is often described as developing by two different methods: intramembranous (in membrane), and endochondral (in cartilage). The fundamental process is, however, similar. An organic matrix, the osteoid, is laid down by cells, the osteoblasts. This becomes calcified with the deposition of amorphous and crystalline apatite. The bones of the calvarium of the skull are formed by intramembranous ossification, the basal bones of the skull and the majority of bones of the skeleton by endochondral ossification.

1.1. Intramembranous ossification

In early foetal life a condensation of mesenchyme cells occurs in the case of both membrane and endochondral bone formation. In the former a group of cells differentiate into osteoblasts, so forming centres of ossification (Ham 1974). These cells secrete osteoid and in so doing some of them become surrounded and become osteocytes lying in their lacunae. Others continue to form osteoid and surround ingrowing capillaries which will bring in the haemopoietic cells of the future marrow (Ham 1974), (Fig. 1.1). Spicules of bone are found radiating out from the ossification centre as a result of matrix formation by the osteoblasts lying on the surface of the condensation, thus creating a spongy type of bone. Calcification of the osteoid proceeds by the same process of vesicle formation as is seen in trabecular bone (see p. 37) (Bernard and Pease 1969). In early foetal life, in human or long gestation species, resorption and apposition begin to take place, so that the spongy or cancellous bone occupies the centre of the mass while a layer of compact bone is formed on each surface by the continuous addition of new sheets of bone by the active osteoblasts.

FIG. 1.1. High-power photomicrograph of a transverse section of a forming trabecula of bone, in the developing skull of a pig embryo. Osteoblasts arranged around its periphery are laying down intercellular substance of bone. Some bone cells have entirely surrounded themselves with intercellular substance so as to become buried as osteocytes in it; these reside in lacunae. (From Ham and Cormack (1979) by courtesy of authors and publishers.)

1.2. Endochondral ossification

In an area of mesenchymal condensation, in the case of endochondral ossification, cells with oval or round nuclei appear packed together forming a model of the future bone (Fig. 1.2). These cells surround themselves with an intracellular matrix or ground substance which is largely composed of glycoproteins peculiar to cartilage (see p. 58). The cells at the periphery of the original condensation become orientated to form, which is described as a perichondrium. The inner layer of cells of this perichondrium differentiate and can be shown to contain alkaline phosphatase, the *sine qua non* of the osteoblast. These differentiated cells lay down a layer of osteoid, i.e. the matrix characteristic of bone. This immediately calcifies, so becoming a collar of periosteal bone directly in contact with the cartilaginous model. The cartilage cells in the centre of the model have in the meantime undergone degenerative changes which are associated with some calcification (Fig. 1.3). Capillaries from outside the perichondrium push through the perichondrium and the periosteal bone and invade the degenerating cartilage cells carrying with them stromal cells from the inner layers of the perichondrium which will form the marrow stroma (Jotereau and Le Douarin 1978) (Fig. 1.3). The vessels arborize and ultimately, together with their stromal cuff derived from
