ADVANCES OF ACCELERATOR PHYSICS AND TECHNOLOGIES

ADVANCED SERIES ON DIRECTIONS IN HIGH ENERGY PHYSICS*Published*

- Vol. 1 – High Energy Electron–Positron Physics
(eds. A. Ali and P. Sodding)
- Vol. 2 – Hadronic Multiparticle Production
(ed. P. Carruthers)
- Vol. 3 – CP Violation
(ed. C. Jarlskog)
- Vol. 4 – Proton–Antiproton Collider Physics
(eds. G. Altarelli and L. Di Lella)
- Vol. 5 – Perturbative QCD
(ed. A. Mueller)
- Vol. 6 – Quark–Gluon Plasma
(ed. R. C. Hwa)
- Vol. 7 – Quantum Electrodynamics
(ed. T. Kinoshita)
- Vol. 9 – Instrumentation in High Energy Physics
(ed. F. Sauli)
- Vol. 10 – Heavy Flavours
(eds. A. J. Buras and M.
- Vol. 11 – Quantum Fields on the
(ed. M. Creutz)
- Vol. 12 – Advances of Accelerators
(ed. H. Schopper)
- Vol. 13 – Perspectives on High Energy Physics
(ed. G. L. Kane)

Forthcoming

- Vol. 8 – Standard Model, Higgs and Weak Decays on the TeV Scale
(ed. G. Martinelli)
- Vol. 14 – Precision Tests of the Standard Model
(ed. P. Langacker)

PREFACE

This book reviews the state of the art of accelerator physics and technologies as well as the use of accelerators in research, industry and medicine. The principles of operating the different types of accelerators (linear, circular and storage rings) are described and the phenomena limiting their performance according to our present understanding are explained. The main aim is to guide the user or expert to the most relevant issues and recent achievements of modern accelerator technology and to review the most interesting applications.

The book should be of interest not only to researchers and engineers in the field but also to users of accelerators who want to have a better understanding of their tool. Moreover, teachers interested in accelerators and their applications will profit from the book and be brought up to date.

An introductory article explains the progress achieved in elementary particle physics with the help of accelerators.

The articles in the second part cover general problems of operation as well as particular issues, for example collective phenomena and instabilities. Recent achievements, such as RF quadrupole accelerators and accelerators for special purposes (heavy ion facilities or heavy quark factories), and the road to future developments are described. This should give, both to users of accelerators and to experts, a view on present and future possibilities of accelerator performance and use.

In the fourth part, new technologies which have been developed for accelerators are presented, covering a variety of subjects, such as superconducting magnets, RF cavities and beam cooling. Special topics like high performance ion sources and geodesy, which have been developed for accelerators but are important to other fields, are also discussed. Some ideas which seemed to be very promising at the time but failed are treated, too.

The last part is devoted to the most important applications of accelerators in industry and medicine. But also covered are sources for synchrotron radiation, pulsed neutrons and heavy ions for nuclear fusion.

The articles have been written by experts of great international reputation and long experience, which guarantees the quality of the contributions, and I should like to thank those people for their efforts.

CONTENTS

Preface	xxi
I INTRODUCTION	
1 What Can We Learn from Experiments with Accelerators and Storage Rings?	3
<i>by C. Jarlskog</i>	
1 Introduction	3
2 The Three Sectors of the Electroweak Model	5
3 The Electroweak Model	6
4 Untested Parts of the Electroweak Model	9
5 The Number of Families, N_{fam}	10
6 The Top Quark	13
6.1 Evading limits on the top mass	16
7 The Higgs Boson	16
7.1 No fundamental Higgs?	18
8 QCD.....	19
9 Beyond the Standard Model	20
9.1 Grand unification and supersymmetry	20
9.2 Other extended gauge models	22
10 Links with Cosmology.....	23
11 Why Higher Energy Accelerators	23
References	25
II CIRCULAR ACCELERATORS AND STORAGE RINGS	
2 Beam Optics and Lattice Design	31
<i>by P. J. Bryant</i>	
1 Introduction	31
2 Advent of Alternating Gradient Focusing	32
3 Brief Introduction to Lattice Analysis	34
3.1 Matrix formulation of lattice	36

3.2 Parameterization of the particle motion	38
3.3 General features of the particle motion	40
4 Early Lattice Design	42
4.1 Long lattices and arcs	42
4.2 Collins' straight section	44
5 Matching and General Lattice Design	44
5.1 Dispersion suppressors	45
5.2 Low- β insertions	47
5.3 Extraction and injection	49
5.4 Machine geometries	51
5.4.1 Particle-antiparticle storage rings	51
5.4.2 Two-ring colliders	52
5.4.3 Lattice symmetries	53
5.5 Impact of superconductivity	54
6 More Exotic Interaction Regions	54
6.1 Final focus schemes	54
6.2 Disruption	55
6.3 Zero-angle crossing in two-ring colliders	55
6.4 Crab crossing	56
6.5 Monochromator	57
6.6 Achromatic dissipative focusing and apochromatic focusing	57
7 Other Insertions, Special Lattices and Exotic Elements	57
7.1 Particle collection after a target	57
7.2 Imaginary transition lattices	58
7.3 Terwilliger scheme	59
7.4 Stochastic cooling	59
7.5 Electron cooling	60
7.6 Crystal extraction	60
8 High-Brightness Lattices	60
9 Future Trends	63
References	63
3 Collective Phenomena and Instabilities	67
<i>by J. Gareyte</i>	
1 Introduction	67
2 Beam Modes	68

2.1	Continuous beams	68
2.2	Bunch mode	70
2.2.1	Longitudinal modes	71
2.2.2	Transverse modes	74
2.2.3	The effect of chromaticity on transverse modes	77
3	Wake Fields and Coupling Impedances	80
4	Classical Instabilities and Collective Effects	85
4.1	Instabilities mechanism	85
4.2	Short range effects	85
4.3	The head-tail instability	87
4.4	Coupled bunch instabilities	88
5	Landau Damping	91
6	Beam Breakup and Mode Coupling Instability	94
6.1	Beam breakup	94
6.2	Mode coupling instability	97
7	Longitudinal Turbulence and Bunch Lengthening	101
8	Conclusion	102
	References	103
4	The Relativistic Heavy Ion Collider, RHIC	104
	<i>by H. Foelsche, H. Hahn, M. Harrison, S. Ozaki and M. J. Rhoades-Brown</i>	
1	Introduction	104
2	Scope of the RHIC Project	107
2.1	Collider configuration	107
2.2	Collider scenario	109
2.3	Collider performance estimates	110
3	Heavy Ion Injection into RHIC	113
3.1	Overview	113
3.2	The RHIC injector complex	114
4	The RHIC Lattice	119
4.1	Overview of RHIC lattice	119
4.2	The arcs	121
4.3	The insertions or interaction regions	122
4.4	Transition energy and chromaticity	125
5	The RHIC RF System	125

5.1	Overview of rf system	125
5.2	The acceleration rf system	126
5.3	The storage rf system	128
6	Luminosity Lifetime in a Heavy Ion Collider	129
	References	130
5	Beauty- and Tau-Charm Factories	132
	<i>by Y. Baconnier</i>	
1	Introduction	133
2	Particle Physics Requirements	133
2.1	B-factory	133
2.2	Tau-charm factory	135
3	History of the Concept	136
4	Conditions for High Luminosity	136
4.1	Luminosity limitations	137
4.2	Emittance and impedance	138
4.3	Beam-beam parameter	139
5	Tau-Charm Factory Interaction Region	140
5.1	Low beta matching	140
5.2	Separation	141
5.3	Background and masking	142
5.4	Rings linear optics	142
5.5	Dynamic aperture	143
6	B-Factory Interaction Area	143
6.1	Energy transparency	143
6.2	Low beta optics	144
6.3	Magnetic separation	145
6.4	Vertex detector protection	146
7	RF System	146
7.1	The argument for short bunches	147
7.2	RF voltage	147
7.3	Momentum compaction and energy dispersion	148
7.4	Multibunch instabilities	148
7.5	RF technology	148
7.6	RF stability	149
8	Vacuum System	150
9	Nonconventional Schemes	151

9.1	Crab-crossing	151
9.2	Monochromators	153
10	Status of Proposals	154
10.1	Tau-charm factories	154
10.2	B-factories proposals.....	154
	References	156

III LINEAR ACCELERATORS

6	General Aspects of Linear Accelerators	163
	<i>by Pierre Lapostolle</i>	
	Introduction	163
1	Brief History of Linear Accelerators	163
1.1	The original linacs	163
1.2	First electron linacs	164
1.3	First proton linacs	165
2	General Principles of the Dynamics of Acceleration	165
2.1	Phase stability	166
2.2	Focusing problems	169
2.3	Focusing methods	171
3	General Properties of Accelerating Structures	172
3.1	Accelerating structure efficiency; shunt impedance	173
3.2	Sensitivity to perturbations	174
3.3	Types of accelerating structures	175
4	Electron Linacs	179
4.1	Electron injector (source and preacceleration)	179
4.2	Electron acceleration	180
4.3	Electron beam intensity limitations	181
4.4	Electron linac applications	182
5	Proton Linacs	184
5.1	Injection into a proton linac	184
5.2	Drift tube linacs	185
5.3	Side-coupled cavity linacs	185
5.4	Beam brightness limitations in proton linacs	186
5.5	Proton linac applications	188
6	Heavy Ion Linacs	189
6.1	Special difficulties relative to ions	189

6.2 Ion source and injection	189
6.3 Accelerating structures — normal and superconducting	190
6.4 Heavy ion linac applications	191
7 Induction Linacs	192
References	193
7 RF Quadrupoles as Accelerators	194
<i>by A. Schempp</i>	
1 Introduction	194
2 RFQ Design	197
2.1 Beam dynamics design considerations	197
2.2 RF-cavity design	201
3 Performance of RFG Accelerators	205
3.1 High current injectors	205
3.2 Heavy ion RFQs	210
3.3 Special applications	214
4 Conclusions	216
References	217
8 Accelerator Physics of the Stanford Linear Collider and SLC Accelerator Experiments Towards the Next Linear Collider	219
<i>by John T. Seeman</i>	
1 Introduction	220
2 Polarized Electron Source	223
3 Damping Rings	225
4 Bunch Length Compressor	227
5 Linear Accelerator	229
5.1 Longitudinal effects	229
5.2 Transverse effects	230
6 Arcs	237
7 Final Focus	238
8 Detector Backgrounds	241
9 SLC Results	241
10 Studies of the Next Linear Collider at the SLC	243

10.1	Final focus test beam (FFTB)	243
10.2	Emittance dynamics test area (EDTA) at the SLC	246
10.3	Acceleration structure setup (ASSET) in the SLC	247
