Wireless Communication Systems

This practically-oriented, all-inclusive guide covers all the major enabling techniques for current and next-generation cellular communications and wireless networking systems. Technologies covered include CDMA, OFDM, UWB, turbo and LDPC coding, smart antennas, wireless ad hoc and sensor networks, MIMO, and cognitive radios, providing readers with everything they need to master wireless systems design in a single volume.

Uniquely, a detailed introduction to the properties, design, and selection of RF subsystems and antennas is provided, giving readers a clear overview of the whole wireless system. It is also the first textbook to include a complete introduction to speech coders and video coders used in wireless systems.

Richly illustrated with over 400 figures, and with a unique emphasis on practical and state-of-the-art techniques in system design, rather than on the mathematical foundations, this book is ideal for graduate students and researchers in wireless communications, as well as for wireless and telecom engineers.

Ke-Lin Du is currently a researcher in the Center for Signal Processing and Communications at Concordia University, Canada. Prior to joining Concordia University in 2001, he held positions with Huawei Technologies, the China Academy of Telecommunication Technology, and the Chinese University of Hong Kong. He visited the Hong Kong University of Science and Technology in 2008. His current research interests include signal processing, wireless communications, RF systems, and neural networks. He is a Senior Member of the IEEE.

M. N. S. Swamy is currently a Director of the Center for Signal Processing and Communications in the Department of Electrical and Computer Engineering, Concordia University, where he was Dean of the Faculty of Engineering and Computer Science from 1977 to 1993. He has published extensively in the areas of circuits, systems, and signal processing, co-authoring four books. Professor Swamy is a Fellow of the IEEE, IET (UK), and EIC (Canada), and has received many IEEE-CAS awards, including the Guillemin-Cauer award in 1986, as well as the Education Award and the Golden Jubilee Medal, both in 2000.

To My Son Cynric K.-L. Du and To My Parents M. N. S. Swamy

Preface

In the last three decades, the explosive growth of mobile and wireless communications has radically changed the life of people. Wireless services have migrated from the conventional voice-centric services to data-centric services. The circuit-switched communication network is now being replaced by the all-IP packet-switched network. Mobile communications have also evolved from the first-generation (1G) analog systems to the third-generation (3G) systems now being deployed, and the fourth-generation (4G) systems are now under development and are expected to be available by 2010. The evolution of wireless networking has also taken place rapidly during this period, from low-speed wireless local-area networks (LANs) to broadband wireless LANs, wireless metropolitan-area networks (MANs), wireless wide-area networks (WANs), and wireless personal-area networks (PANs). Also, broadband wireless data service has been expanded into broadcasting service, leading to satellite TV broadcasting and wireless regional-area networks (RANs) for digital TV. The data rate has also evolved from the 10 kbits/s voice communications to approximately 1 Gbit/s in the 4G wireless network. In addition, the 4G wireless network will provide ubiquitous communications.

Scope and Purpose

A complete wireless system involves many different areas. However, most existing textbooks on wireless communications focus only on the fundamental principles of wireless communications, while many other areas associated with a whole wireless system, such as digital signal processing, antenna design, microwave and radio frequency (RF) subsystem design, speech coding, video coding, and channel coding, are left to other books.

This book provides a broad, also in certain depth, technical view of wireless communications, covering various aspects of radio systems. Various enabling technologies for modern wireless communications are also included. Unlike the existing books in the field, this book is organized from a wireless system designer's viewpoint. We give wide coverage to the techniques that are most relevant to the design of wireless communication and networking systems. We focus ourselves on the lower layers of wireless systems, since the upper layers such as network layers and transport layers are topics of general data communication systems. Due to limited space, we do not provide lengthy mathematical details, but rather emphasize the practical aspects.

The book is divided into twenty-two chapters, including introduction, overwiew of wireless communications and networking, wireless channel and radio propagation, cellular systems and multiple access, diversity, channel equalization, modulation and detection, spread-spectrum communications, orthogonal frequency division multiplexing (OFDM), **xxiv** Preface

antennas, RF and microwave subsystems, A/D and D/A conversions, digital signal processing, information theory, ultra wideband (UWB) communications, speech/audio coding, image/video coding, channel coding, smart antennas, multiple input multiple output (MIMO) systems, cognitive radios, and wireless ad hoc/sensor networks. Each chapter contains some examples and problems.

Intended Audience

This book is primarily intended as a textbook for advanced undergraduate and graduate students specializing in wireless communications and telecommunication systems. It is also a good reference book for practicing engineers. The reader is supposed to have a background in electrical engineering and to be familiar with the theory of signals and systems, probabilities and stochastic processes, basic circuits, basic digital communications, linear algebra, and advanced calculus. These courses are offered in most electrical engineering undergraduate programs. The contents are useful for mobile cellular communications, satellite communication, and wireless networking.

The material in this book can be taught in two semesters. The first semester may cover Chapters 1 to 13, which deal with the principles of wireless communications, and the analog and digital designs. The second semester could cover the remaining chapters, including information theory and coding, and some advanced and emerging technologies. If only one semester is available for this course, we suggest teaching Chapters 1 to 13, 15, and selected sections from Chapters 18 to 22. Since each chapter is rather comprehensive on the topics treated and is relatively self-contained, the reader can select to read only those chapters that are of interest. MATLAB codes for the examples in the book are downloadable from the book website.

Acknowledgments

First of all, we would like to thank the anonymous reviewers, whose comments have enriched this book. Our appreciation is extended to Ayhan Altintas of Bilkent University (Turkey) for commenting on Chapters 3 and 10, Chunjiang Duanmu of Zhejiang Normal University (China) for reviewing Chapter 17, and Wai Ho Mow of Hong Kong University of Science and Technology (China) for his valuable comments on Chapter 21. The authors would like to express their special thanks to Ezio Biglieri and Giorgio Taricco from Politecnico di Torino (Italy) for helpful discussion.

K.-L. Du would like to express his gratitude to Wei Wu of Concordia University (Canada), Doru Florin Chiper of Technical University "Gh. Asachi" Iasi (Romania), Jie Zeng of Meidian Technologies (China), Yi Shen of Huazhong University of Science and Technology (China), Hong Bao and Jiabin Lu of Guangdong University of Technology (China), Qiang Ni of Brunel University (UK), Yin Yang and Daniel Gaoyang Dai from Hong Kong University of Science and Technology (China), Xiangming Li of Beijing Institute of Technology (China), Qingling Zhang of ZTE Corporation (China), Yi Zhang of Huawei Technologies (China), and Andrew Chi-Sing Leung from City University of Hong Kong (China) for their personal help during the period of preparing this book.

xxv Preface

M. N. S. Swamy also wishes to thank his family for their support during the period of preparing this book.

We feel extremely fortunate to have worked with Cambridge University Press. We express our utmost appreciation to Philip Meyler, Publishing Director, Engineering, Mathematical and Physical Sciences, at Cambridge University Press, for his guidance. The encouragement and support provided by Philip Meyler has made the process of writing this book very joyful. Finally, special thanks go to the staff from Cambridge University Press: Sabine Koch, Sarah Matthews, Caroline Brown, Anna Marie Lovett, Richard Marston, and Sehar Tahir, without whose help the production of the book would have been impossible.

Feedback

A book of this length is certain to have some errors and omissions. While we have made significant attempts to a comprehensive description of major techniques related to modern wireless communications, there are many new emerging techniques, some of which may not have been included. Feedback is welcome via email at kldu@ieee.org or swamy@ece.concordia.ca, and we promise to reply to all the messages.
