INTRODUCTION TO
CHEMICAL
PRINCIPLES

Preface

Introduction to Chemical Principles is a text for students who have had little or no previous instruction in chemistry or who had such instruction long enough ago that a thorough review is needed. The text's purpose is to give students the background (and confidence) needed for a subsequent successful encounter with a main sequence college level general chemistry course.

Many texts written for preparatory chemistry courses are simply “watered down” versions of general chemistry texts; they treat almost all topics found in the general chemistry course, but at a superficial level. *Introduction to Chemical Principles* does not fit this mold. The author's philosophy is that it is better to treat fewer topics extensively and have the student understand those topics in greater depth. The very real temptation to include “lots and lots” of additional concepts in this new edition of the text was resisted. Instead the focus for the revision was on rewriting selected portions to improve the clarity of presentation.

Important Features of This Textbook

1. Because of the varied degrees of understanding of chemical principles possessed by students taking a preparatory chemistry course, development of each topic in this text starts at “ground level” and continues step by step until the level of sophistication required for a further chemistry course is attained.
2. Problem solving receives major emphasis. Over twenty years of teaching experience indicate to the author that student “troubles” in general chemistry courses are almost always centered in the inability to set up and solve problems. Whenever possible, dimensional analysis is used in problem solving. This method, which requires no mathematics beyond arithmetic and elementary algebra, is a powerful and widely applicable problem-solving tool. Most important, it is a method that an average student can master with an average amount of diligence. Mastering dimensional analysis also helps build the confidence that is so valuable for future chemistry courses.
3. Significant figure concepts are emphasized in all problem-solving situations.

Routinely, electronic calculators display answers that contain more digits than are needed or acceptable. In all worked-out examples, students are reminded about these “unneeded digits” by the appearance of two answers to the example: the calculator answer (which does not take into account significant figures) and, in color, the correct answer (which is the calculator answer adjusted to the correct number of significant figures).

4. Numerous worked-out example problems are found within the textual material with detailed commentary accompanying each such example. In addition an unworked practice exercise is coupled to each example. It is intended that students will work this exercise immediately after “working through” the example. For immediate feedback, the answer to each practice exercise follows the exercise.
5. All end-of-chapter exercises occur in “matched pairs”. In essence, each chapter has two independent, but similar, problem sets. Counting subparts to problems, there are over 5000 questions and problems available for a student to use in his or her “struggle” to become proficient at problem solving. Answers to all of the odd-number problems are found at the end of the text. Thus, two problem sets exist, one with answers and one without answers.
6. Each end-of-chapter problem set, except for Chapters 1 and 2, is divided into four sections: (1) Practice Problems, (2) Additional Problems, (3) Cumulative Problems, and (4) Grid Problems. The practice problems are categorized by topic and are arranged in the same sequence as the chapter’s textual material. These problems, which are always single-concept, are “drill” problems which most students will find “routine”. The additional problem section contains problems that involve more than one concept from the chapter and are usually more difficult than the practice problems. The cumulative-skills section draws not only on materials from the current chapter but also on concepts discussed in previous chapters. The working of problems in this third group allows students to continue to use, rather than forget, problem-solving techniques presented earlier. Finally, each chapter ends with four grid problems. Here students apply the principles from the chapter in a setting where multiple concepts are examined at the same time. Answers are selected from a three-by-three grid of choices; most often multiple answers are correct.

Supplements

A Student Solutions Manual has been prepared to accompany this text, and an Instructor’s Resource Manual with Test Bank is available to adopters.

Acknowledgments

As always, the valuable contributions of reviewers are gratefully acknowledged: Paul E. Jacobson, Tacoma Community College; L. A. Kuprenas, California State University, Long Beach; and George Schenk, Wayne State University.

Contents

CHAPTER ONE

The Science of Chemistry	1
1.1 Chemistry—A Scientific Discipline	1
1.2 Scientific Disciplines and Technology	2
1.3 The Scope of Chemistry and Chemical Technology	3
1.4 How Chemists Discover Things—The Scientific Method	4
Key Terms	9
Practice Problems	9

CHAPTER TWO

Numbers from Measurements	11
2.1 The Importance of Measurement	11
2.2 Accuracy, Precision, and Error	12
2.3 Significant Figures—A Method for Handling Uncertainty in Measurements	13
2.4 Significant Figures and Calculated Quantities	19
2.5 Scientific Notation	27
2.6 Scientific Notation and Mathematical Operations	33
Key Terms	40
Practice Problems	40
Additional Problems	45
Grid Problems	47

CHAPTER THREE

Unit Systems and Dimensional Analysis	48
3.1 The Metric System of Units	48
3.2 Metric Units of Length	50
3.3 Metric Units of Mass	52

- 3.4 Metric Units of Volume 54
- 3.5 Units in Mathematical Operations 57
- 3.6 Conversion Factors 59
- 3.7 Dimensional Analysis 62
- 3.8 Density 74
- 3.9 Percent as a Conversion Factor 78
- 3.10 Temperature Scales 81
- 3.11 Types and Forms of Energy 85
- 3.12 Heat Energy and Specific Heat 87
 - Key Terms 93 · Practice Problems 94 · Additional Problems 98
 - Cumulative Problems 99 · Grid Problems 100

CHAPTER FOUR

Basic Concepts About Matter

102

- 4.1 Chemistry—The Study of Matter 102
- 4.2 Physical States of Matter 103
- 4.3 Properties of Matter 104
- 4.4 Changes in Matter 106
- 4.5 Mixtures and Pure Substances 109
- 4.6 Types of Mixtures: Heterogeneous and Homogeneous 111
- 4.7 Types of Pure Substances: Elements and Compounds 113
- 4.8 Discovery and Abundance of the Elements 116
- 4.9 Names and Symbols of the Elements 117
- 4.10 Provisional Names for New Elements 119
 - Key Terms 121 · Practice Problems 121 · Additional Problems 125
 - Cumulative Problems 125 · Grid Problems 126

CHAPTER FIVE

Atoms, Molecules, Formulas, and Subatomic Particles

128

- 5.1 The Atom 128
- 5.2 The Molecule 130
- 5.3 Natural and Synthetic Compounds 133
- 5.4 Chemical Formulas 133
- 5.5 Subatomic Particles: Protons, Neutrons, and Electrons 136
- 5.6 Evidence Supporting the Existence and Arrangement of Subatomic Particles 139
- 5.7 Atomic Number and Mass Number 143
- 5.8 Isotopes 145
- 5.9 Atomic Masses 148
 - Key Terms 156 · Practice Problems 157 · Additional Problems 161
 - Cumulative Problems 162 · Grid Problems 162

CHAPTER SIX

Electronic Structure and Chemical Periodicity 164

- 6.1 The Periodic Law 164
- 6.2 The Periodic Table 165
- 6.3 The Energy of an Electron 169
- 6.4 Electron Shells 170
- 6.5 Electron Subshells 172
- 6.6 Electron Orbitals 173
- 6.7 Writing Electron Configurations 176
- 6.8 Orbital Diagrams 180
- 6.9 Electron Configurations and the Periodic Law 183
- 6.10 Electron Configurations and the Periodic Table 184
- 6.11 Classification Systems for the Elements 191
- 6.12 Chemical Periodicity 193
 - Key Terms 196 · Practice Problems 197 · Additional Problems 200
 - Cumulative Problems 202 · Grid Problems 202

CHAPTER SEVEN

Chemical Bonding 204

- 7.1 Chemical Bonds 204
- 7.2 Valence Electrons and Electron-Dot Structures 205
- 7.3 The Octet Rule 207
- 7.4 Ions and Ionic Bonds 208
- 7.5 Ionic Compound Formation 211
- 7.6 Formulas for Ionic Compounds 215
- 7.7 Structure of Ionic Compounds 217
- 7.8 Polyatomic Ions 218
- 7.9 The Nature of a Covalent Bond 220
- 7.10 Electronegativities and Bond Polarities 225
- 7.11 Multiple Covalent Bonds 231
- 7.12 Coordinate Covalent Bonds 234
- 7.13 Resonance Structures 235
- 7.14 A Systematic Method for Determining Electron-Dot Structures 236
- 7.15 Molecular Polarity 242
- 7.16 Predicting Molecular Geometries (VSEPR Theory) 246
 - Key Terms 254 · Practice Problems 255 · Additional Problems 261
 - Cumulative Problems 262 · Grid Problems 263

CHAPTER EIGHT

Chemical Nomenclature 265

- 8.1 Nomenclature Classifications for Compounds 265
- 8.2 Types of Binary Ionic Compounds 266

- 8.3 Nomenclature for Binary Ionic Compounds 268
8.4 Nomenclature for Ionic Compounds Containing Polyatomic Ions 273
8.5 Nomenclature for Binary Molecular Compounds 276
8.6 Nomenclature for Acids 279
8.7 Nomenclature Rules—A Summary 284
Key Terms 287 · Practice Problems 288 · Additional Problems 291
· Cumulative Problems 292 · Grid Problems 293

CHAPTER NINE

Chemical Calculations: The Mole Concept and Chemical Formulas

295

- 9.1 The Law of Definite Proportions 295
9.2 Calculation of Formula Masses 298
9.3 Percent Composition 301
9.4 The Mole: The Chemist's Counting Unit 303
9.5 The Mass of a Mole 307
9.6 Counting Particles by Weighing 313
9.7 The Mole and Chemical Formulas 316
9.8 The Mole and Chemical Calculations 318
9.9 Determination of Empirical and Molecular Formulas 324
Key Terms 332 · Practice Problems 332 · Additional Problems 338
· Cumulative Problems 339 · Grid Problems 340

CHAPTER TEN

Chemical Calculations Involving Chemical Equations

342

- 10.1 The Law of Conservation of Mass 342
10.2 Writing Chemical Equations 344
10.3 Balancing Chemical Equations 345
10.4 Special Symbols Used in Equations 350
10.5 Patterns in Chemical Reactivity 351
10.6 Classes of Chemical Reactions 353
10.7 Chemical Equations and the Mole Concept 356
10.8 Calculations Based on Chemical Equations—Stoichiometry 359
10.9 The Limiting Reactant Concept 365
10.10 Yields: Theoretical, Actual, and Percent 370
10.11 Simultaneous and Consecutive Reactions 372
Key Terms 375 · Practice Problems 375 · Additional Problems 382
· Cumulative Problems 383 · Grid Problems 385

CHAPTER ELEVEN

States of Matter

387

- 11.1 Physical States of Matter 387
- 11.2 Property Differences of Physical States 389
- 11.3 The Kinetic Molecular Theory 390
- 11.4 The Solid State 392
- 11.5 The Liquid State 392
- 11.6 The Gaseous State 393
- 11.7 A Comparison of Solids, Liquids, and Gases 394
- 11.8 Endothermic and Exothermic Changes of State 395
- 11.9 Temperature Change as a Substance Is Heated 395
- 11.10 Energy and Changes of State 397
- 11.11 Heat Energy Calculations 400
- 11.12 Evaporation of Liquids 404
- 11.13 Vapor Pressure of Liquids 407
- 11.14 Boiling and Boiling Point 408
- 11.15 Intermolecular Forces in Liquids 410
- 11.16 Water—A Most Unusual (Unique) Substance 413
- 11.17 Types of Solids 419
 - Key Terms 422 · Practice Problems 423 · Additional Problems 426
 - Cumulative Problems 427 · Grid Problems 427

CHAPTER TWELVE

Gas Laws

429

- 12.1 Properties of Some Common Gases 429
- 12.2 Gas Law Variables 430
- 12.3 Boyle's Law: A Pressure–Volume Relationship 435
- 12.4 Charles's Law: A Temperature–Volume Relationship 440
- 12.5 Gay-Lussac's Law: A Temperature–Pressure Relationship 444
- 12.6 The Combined Gas Law 445
- 12.7 Standard Conditions for Temperature and Pressure 449
- 12.8 Gay-Lussac's Law of Combining Volumes 450
- 12.9 Avogadro's Law: A Volume–Quantity Relationship 453
- 12.10 Molar Volume of a Gas 455
- 12.11 The Ideal Gas Law 460
- 12.12 Equations Derived from the Ideal Gas Law 463
- 12.13 Gas Laws and Chemical Equations 466
- 12.14 Dalton's Law of Partial Pressures 469
 - Key Terms 475 · Practice Problems 475 · Additional Problems 482
 - Cumulative Problems 483 · Grid Problems 484

CHAPTER THIRTEEN

Solutions

486

- 13.1 Types of Solutions 486
- 13.2 Terminology Used in Describing Solutions 488
- 13.3 Solution Formation 489
- 13.4 Solubility Rules 491
- 13.5 Solution Concentrations 493
- 13.6 Concentration: Percentage of Solute 494
- 13.7 Concentration: Parts per Million and Parts per Billion 498
- 13.8 Concentration: Molarity 500
- 13.9 Concentration: Molality 506
- 13.10 Dilution 509
- 13.11 Molarity and Chemical Equations 512
 - Key Terms 516 · Practice Problems 517 · Additional Problems 522
 - Cumulative Problems 524 · Grid Problems 525

CHAPTER FOURTEEN

Acids, Bases, and Salts

527

- 14.1 Arrhenius Acid–Base Theory 527
- 14.2 Brønsted–Lowry Acid–Base Theory 528
- 14.3 Conjugate Acids and Bases 530
- 14.4 Polyprotic Acids 533
- 14.5 Strengths of Acids and Bases 535
- 14.6 Salts 538
- 14.7 Ionic and Net Ionic Equations 539
- 14.8 Reactions of Acids 544
- 14.9 Reactions of Bases 546
- 14.10 Reactions of Salts 546
- 14.11 Dissociation of Water 551
- 14.12 The pH Scale 553
- 14.13 Hydrolysis of Salts 561
- 14.14 Buffer Solutions 564
- 14.15 Buffers in the Human Body 565
- 14.16 Acid–Base Titrations 567
- 14.17 Acid–Base Titration Calculations Using Normality 569
- 14.18 Acid and Base Stock Solutions 574
 - Key Terms 575 · Practice Problems 576 · Additional Problems 583
 - Cumulative Problems 584 · Grid Problems 584

CHAPTER FIFTEEN

Oxidation and Reduction

586

- 15.1 Oxidation–Reduction Terminology 586
- 15.2 Oxidation Numbers 588

- 15.3 Types of Chemical Reactions 594
- 15.4 Balancing Oxidation–Reduction Equations 596
- 15.5 Using the Oxidation Number Method to Balance Redox Equations 597
- 15.6 Using the Ion-Electron Method to Balance Redox Equations 603
- 15.7 Disproportionation Reactions 611
- 15.8 Some Important Oxidation-Reduction Reactions 614
 - Key Terms 622 · Practice Problems 623 · Additional Problems 627
 - Cumulative Problems 628 · Grid Problems 629

CHAPTER SIXTEEN

Reaction Rates and Chemical Equilibrium

630

- 16.1 Theory of Reaction Rates 630
- 16.2 Potential Energy Diagrams for Chemical Reactions 632
- 16.3 Factors That Influence Reaction Rates 634
- 16.4 Chemical Equilibrium 637
- 16.5 Equilibrium Mixture Stoichiometry 639
- 16.6 Equilibrium Constants 641
- 16.7 Le Châtelier's Principle 646
- 16.8 Forcing Reactions to Completion 651
 - Key Terms 651 · Practice Problems 652 · Additional Problems 656
 - Cumulative Problems 657 · Grid Problems 658

CHAPTER SEVENTEEN

Nuclear Chemistry

660

- 17.1 Atomic Nuclei 660
- 17.2 Discovery of Radioactivity 662
- 17.3 Nature of Natural Radioactive Emissions 662
- 17.4 Equations for Nuclear Reactions 664
- 17.5 Rate of Radioactive Decay 667
- 17.6 Induced Radioactivity: Bombardment Reactions 671
- 17.7 Positron Emission and Electron Capture 674
- 17.8 Nuclear Stability 676
- 17.9 Radioactive Decay Series 678
- 17.10 Ionizing Effects of Radiation 680
- 17.11 Biological Effects of Various Types of Radiation 681
- 17.12 Detection of Radiation 682
- 17.13 Sources of Radiation Exposure 683
- 17.14 Nuclear Medicine 684
- 17.15 Nuclear Fission and Nuclear Fusion 686
- 17.16 A Comparison of Nuclear and Chemical Reactions 689
 - Key Terms 690 · Practice Problems 690 · Additional Problems 694
 - Cumulative Problems 695 · Grid Problems 696

CHAPTER EIGHTEEN

Hydrocarbons and Hydrocarbon Derivatives

698

- 18.1 Organic Chemistry—A Historical Perspective 698
- 18.2 Hydrocarbons 700
- 18.3 Alkanes 700
- 18.4 Structural Isomerism of Hydrocarbons 702
- 18.5 IUPAC Nomenclature for Noncyclic Alkanes 704
- 18.6 Structure and Nomenclature of Cycloalkanes 711
- 18.7 Structure and Nomenclature of Alkenes and Alkynes 712
- 18.8 Aromatic Hydrocarbons 716
- 18.9 Sources and Uses of Hydrocarbons 720
- 18.10 Derivatives of Hydrocarbons 722
- 18.11 Halogenated Hydrocarbons (Organic Halides) 723
- 18.12 Alcohols 726
- 18.13 Ethers 728
- 18.14 Carboxylic Acids 730
- 18.15 Esters 732
 - Key Terms 734 · Practice Problems 734 · Additional Problems 742
 - Cumulative Problems 742 · Grid Problems 743

APPENDIX

Mathematical Review

A.1

- A.1 Basic Mathematical Operations A.1
- A.2 Fractions A.2
- A.3 Positive and Negative Numbers A.6
- A.4 Solving Algebraic Equations A.8

ANSWERS TO ODD-NUMBERED PROBLEMS A.13

INDEX I.1

The Science of Chemistry

1.1 Chemistry—A Scientific Discipline

During the entire time of their existence on Earth, human beings have been concerned with and fascinated by their surroundings. This desire to understand their surroundings—an attribute that distinguishes them from all other living organisms—has led them to accumulate vast amounts of information concerning themselves, their world, and the universe. **Science** is the study in which humans attempt to organize and explain in a systematic and logical manner knowledge about themselves and their surroundings.

The enormous range of types of information covered by science, the sheer amount of accumulated knowledge, and the limitations of human mental capacity relative to mastering such a large and diverse body of knowledge have led to the division of the whole of science into smaller subdivisions called scientific disciplines. A **scientific discipline** is a branch of scientific knowledge limited in its size and scope to make it more manageable. Chemistry is one of the scientific disciplines. Astronomy, botany, geology, physics, and zoology are some of the others.

FIGURE 1.1 Interrelationship of scientific disciplines.

In a sense, the boundaries between scientific disciplines are artificial, because all scientific disciplines borrow information and methods from each other. No scientific discipline is totally independent. This overlap requires that scientists, in addition to having in-depth knowledge of a selected discipline, also have limited knowledge of other disciplines. Problems scientists have encountered in the last decade have particularly pointed out the interdependence of disciplines. For example, chemists attempting to solve the problem of chemical contamination of the environment find that they need some knowledge of geology, zoology, and botany. Because of this overlap, it is now common to talk not only of chemists, but also of geochemists, biochemists, chemical physicists, and so on. Figure 1.1 shows how chemistry merges with some of the other scientific disciplines.

The overlap of the various scientific disciplines affects not only practicing scientists but also today's college students. It means that students must necessarily study in disciplines other than those of primary interest to them. The knowledge they gain from such studies is often useful and even essential if they are to be competent in their chosen field. Many students in courses for which this textbook is written are studying chemistry because of its applicability to other disciplines in which they have a more specific interest.

1.2 Scientific Disciplines and Technology

Scientific disciplines represent abstract bodies of knowledge. The abstractness of such knowledge is modified by technology. **Technology** is the physical application of scientific knowledge to the production of new products to improve human survival, comfort,

and quality of life. Technology manipulates nature for advantage. Technological advances began affecting our society about 200 years ago, and new advances still continue, at an accelerating pace, to have a major impact on human society. Section 1.3 considers numerous contributions of chemical technology to human well-being.

Technology, like science, involves human activities. Whether or not a given piece of scientific knowledge is technologically used for good or evil purposes depends on the motives of those men and women, whether in industry or government, who have the decision-making authority. In democratic societies, citizens (the voters) can influence many technological decisions. Therefore, it is important for everyone to be informed about scientific and technological issues.

1.3 The Scope of Chemistry and Chemical Technology

Although chemistry is concerned with only a part of the scientific knowledge that has been accumulated, it is in itself an enormous and broad field. Chemistry touches all parts of our lives.

Many of the clothes we wear are made from synthetic fibers produced by chemical processes. Even natural fibers, such as cotton or wool, are the products of naturally occurring chemical reactions within living systems. Our transportation usually involves vehicles powered with energy obtained by burning chemical mixtures, such as gasoline. The drugs used to cure many of our illnesses are the result of much chemical research. The paper on which this textbook is printed was produced through a chemical process, and the ink used in printing the words and illustrations is a mixture of many chemicals. The movies we watch are possible because of synthetic materials called film. The images on film are produced through the interaction of selected chemicals. Almost all of our recreational pursuits involve objects made of materials produced by chemical industries. Skis, boats, basketballs, bowling balls, musical instruments, and television sets all contain materials that do not occur naturally, but are products of human technological expertise.

Our bodies are a complex mixture of chemicals. Principles of chemistry are fundamental to an understanding of all processes of the living state. Chemical secretions (hormones) produced within our bodies help determine our outward physical characteristics such as height, weight, and appearance. Digestion of food involves a complex series of chemical reactions. Food itself is an extremely complicated array of chemical substances. Chemical reactions govern our thought processes and how knowledge is stored in and retrieved from our brains. In short, chemistry runs our lives.

A formal course in chemistry can be a fascinating experience because it helps us understand ourselves and our surroundings. We cannot truly understand or even know very much about the world we live in or about our own bodies without being conversant with the fundamental ideas of chemistry.
