Analytic Combinatorics in Several Variables

Mathematicians have found it useful to enumerate all sorts of things arising in discrete mathematics: elements of finite groups, configurations of ones and zeros, graphs of various sorts; the list is endless. Analytic combinatorics uses analytic techniques to do the counting: generating functions are defined and their coefficients are then estimated via complex contour integrals. This book is the result of nearly fifteen years of work on developing analytic machinery to recover, as effectively as possible, asymptotics of the coefficients of a multivariate generating function. It is the first book to describe many of the results and techniques necessary to estimate coefficients of generating functions in more than one variable.

Aimed at graduate students and researchers in enumerative combinatorics, the book contains all the necessary background, including a review of the uses of generating functions in combinatorial enumeration as well as chapters devoted to saddle point analysis, Groebner bases, Laurent series and amoebas, and a smattering of differential and algebraic topology. All software along with other ancillary material can be located via the book website, www.cs.auckland.ac.nz/~mcw/Research/mvGF/asymultseq/ACSVbook/.

ROBIN PEMANTLE is a Professor in the Department of Mathematics at the University of Pennsylvania.

MARK C. WILSON is a Senior Lecturer in the Department of Computer Science at the University of Auckland.

To the memory of Philippe Flajolet, on whose shoulders stands all of the work herein.

Preface

The term “analytic combinatorics” refers to the use of complex analytic methods to solve problems in combinatorial enumeration. Its chief objects of study are generating functions (Flajolet and Sedgewick, 2009, page vii). Generating functions have been used for enumeration for more than a hundred years, going back to Hardy and, arguably, to Euler. Their systematic study began in the 1950s (Hayman, 1956). Much of the impetus for analytic combinatorics comes from the theory of algorithms, arising, for example, in the work of Knuth (2006). The recent, seminal work by Flajolet and Sedgewick (2009) describes the rich univariate theory with literally hundreds of applications.

The multivariate theory, as recently as the mid-1990s, was still in its infancy. Techniques for *deriving* multivariate generating functions have been well understood, sometimes paralleling the univariate theory and sometimes achieving surprising depth (Fayolle, Iasnogorodski, and Malyshev, 1999). Analytic methods for recovering coefficients of generating functions once the functions have been derived have, however, been sorely lacking. A small body of analytic work goes back to the early 1980s (Bender and Richmond, 1983); however, even by 1995, of 100+ pages in the *Handbook of Combinatorics* devoted to asymptotic enumeration (Odlyzko, 1995), multivariate asymptotics received fewer than six.

This book is the result of work spanning nearly fifteen years. Our aim has been to develop analytic machinery to recover, as effectively as possible, asymptotics of the coefficients of a multivariate generating function. Both authors feel drawn to this area of study because it combines many areas of modern mathematics. Functions of one or more complex variables are essential, but also algebraic topology in the Russian style, stratified Morse theory, computational algebraic methods, saddle-point integration, and of course the basics of combinatorial enumeration. The many applications of this work in areas such as bioinformatics, queueing theory, and statistical mechanics are not surprising when we realize how widespread is the use of generating functions in applied combinatorics and probability.

The purpose of this book is to pass on what we have learned, so that others may learn it and use it before we forget it. The present form of the book grew out of graduate-level mathematics courses that developed, along with the theory, at

the University of Wisconsin, Ohio State University, and the University of Pennsylvania. The course was intended to be accessible to students in their second year of graduate study. Because of the eclectic nature of the required background, this presents something of a challenge. One may count on students having seen calculus on manifolds by the end of a year of graduate studies, in addition to some complex variable theory. One may also assume some willingness to do some outside reading. However, some of the more specialized areas on which multivariate analytic combinatorics must draw are not easy to get from books. This includes topics such as the theory of amoebas (Gel'fand, Kapranov, and Zelevinsky, 1994) and the Leray-Petrovsky-Gårding theory of inverse Fourier transforms. Other topics such as saddle-point integration and stratified Morse theory exist in books but require being summarized to avoid a semester-long detour.

We have dealt with these problems by summarizing a great amount of background material. Part I contains the combinatorial background and will be known to students who have taken a graduate-level course in combinatorial enumeration. Part II contains mathematical background from outside of combinatorics. The topics in Part II are central to the understanding and execution of the techniques of analytic combinatorics in several variables. Part III contains the theory, all of which is new since the turn of the millennium and only parts of which exist in published form. Finally, there are appendices, almost equal in total size to Part II, which include necessary results from algebraic and differential topology. Some students will have seen these, but for the rest, the inclusion of these topics will make the present book self-contained rather than one that can only be read in a library.

We hope to recruit further researchers into this field, which still has many interesting challenges to offer, and this explains the rather comprehensive nature of the book. However, we are aware that some readers will be more focused on applications and seek the solution of a given problem. The book is structured so that after reading Chapter 1, it should be possible to skip to Part III and pick up supporting material as required from previous chapters. A list of publications using the multivariate methods described in this book can be found on our website: www.cs.auckland.ac.nz/~mcw/Research/mvGF/asymultseq/ACSVbook/.

The mathematical development of the theory belongs mostly to the two authors, but there are a number of individuals whose help was greatly instrumental in moving the theory forward. The complex analysts at the University of Wisconsin-Madison, Steve Wainger, Jean-Pierre Rosay, and Andreas Seeger, helped the authors (then rather junior researchers) to grapple with the problem in its earliest incarnation. A similar role was played several years later by Jeff McNeal. Perhaps the greatest thanks are due to Yuliy Baryshnikov, who translated the Leray-Petrovsky theory and the work of Atiyah-Bott-Gårding into terms the authors could understand and coauthored several articles. Frank Sottile provided help with algebra on many occasions; Persi Diaconis arranged for a graduate course while the

Figure 0.1 Customized “asymptotics of a multivariable generating function” dinner plates.

first author visited Stanford in 2000; Richard Stanley answered our numerous miscellaneous queries. Thanks are also due to our other coauthors on articles related to this project, listed on the project website linked from the book website. Alex Raichev and Torin Greenwood helped substantially with proofreading and with computer algebra implementations of some parts of the book. Thanks also to valuable proofreading contributions from Lily Yen. All software can be located via the book website.

On a more personal level, the first author would like to thank his wife, Diana Mutz, for encouraging him to follow this unusual project wherever it took him, even if it meant abandoning a still productive vein of problems in probability theory. The sentiment in the probability theory community may be otherwise, but the many connections of this work to other areas of mathematics have been a source of satisfaction to the authors. The first author would also like to thank his children, Walden, Maria, and Simi, for their participation in the project via the Make-A-Plate company (see Figure 0.1).

The second author thanks his wife Golbon Zakeri, children Yusef and Yahya, and mother-in-law Shahin Sabetghadam for their help in carving out time for him to work on this project, sometimes at substantial inconvenience to themselves. He hopes they will agree that the result is worth it.

Contents

Preface

PART I: COMBINATORIAL ENUMERATION

1	Introduction	3
1.1	Arrays of Numbers	3
1.2	Generating Functions and Asymptotics	5
1.3	New Multivariate Methods	7
1.4	Outline of the Remaining Chapters	10
	Notes	13
	Exercises	13
2	Generating Functions	15
2.1	Formal Power Series	15
2.2	Rational Operations on Generating Functions	17
2.3	Algebraic Generating Functions	25
2.4	Generating Functions	33
2.5	Exponentiation: Set Partitions	40
	Notes	43
	Exercises	44
3	Univariate Asymptotics	46
3.1	Rational Functions: An Explicit Formula	46
3.2	Saddle Point Methods	50
3.3	Circle Methods	55
3.4	Transfer Theorems	57
	Notes	62
	Exercises	63

PART II: MATHEMATICAL BACKGROUND

4	Fourier-Laplace Integrals in One Variable	67
4.1	Statement of Main Result	67
4.2	Real Integrands	69
4.3	Complex Phase	74
4.4	Classical Methods: Steepest Descent (Saddle Point) and Watson's Lemma	78
4.5	Analytic Versus C^∞ Category	80
	Notes	87
	Exercises	87
5	Fourier-Laplace Integrals in More than One Variable	89
5.1	Overview	89
5.2	Standard Phase	91
5.3	Real Part of Phase Has a Strict Minimum	93
5.4	Localization	97
5.5	Examples and Extensions	103
	Notes	104
	Exercises	105
6	Techniques of Symbolic Computation via Gröbner Bases	106
6.1	Solving Systems of Polynomial Equations	106
6.2	Examples of Gröbner Basis Computation	112
6.3	D-Modules: Computing with D-Finite Functions	116
	Notes	118
	Exercises	118
7	Cones, Laurent Series, and Amoebas	120
7.1	Cones and Dual Cones	121
7.2	Laurent Series	123
7.3	Amoebas	127
	Notes	131
	Exercises	131

PART III: MULTIVARIATE ENUMERATION

8	Overview of Analytic Methods for Multivariate Generating Functions	135
8.1	Exponential Rate	136
8.2	Morse Theory Redux	138
8.3	Critical Points	144

8.4	Minimal Points	148
8.5	Describing the Quasi-Local Cycles	152
8.6	Evaluating the Integral on a Quasi-Local Cycle	157
	Notes	159
	Exercises	159
9	Smooth Point Asymptotics	160
9.1	Smooth Points	161
9.2	The Smooth Point Integral via Surgery	163
9.3	The Smooth Point Integral via Residue Forms	171
9.4	Effectively Computing the Intersection Class in Two Cases	175
9.5	Explicit Formulae for the Leading Term	185
9.6	Limit Laws from Probability Theory	198
	Notes	207
	Exercises	208
10	Multiple Point Asymptotics	209
10.1	Multiple Points	211
10.2	Iterated Residues	219
10.3	Formulae for Coefficients	232
10.4	The Base Case via Surgery	240
	Notes	251
	Exercises	252
11	Cone Point Asymptotics	253
11.1	Cones, Hyperbolicity, and Deformations	254
11.2	Evaluating the Asymptotics	264
11.3	Examples and Consequences	269
	Notes	275
	Exercises	276
12	Worked Examples	278
12.1	Four Independent Examples	278
12.2	Powers, Quasi-Powers, and Riordan Arrays	286
12.3	Lagrange Inversion	292
12.4	Transfer Matrices	295
	Notes	299
	Exercises	299
13	Extensions	300
13.1	The Diagonal Method	300
13.2	Algebraic Generating Functions	304

13.3 Higher-Order Asymptotics	308
13.4 Phase Transitions	312
13.5 Conclusion	313
Notes	314
Exercises	315
PART IV: APPENDIXES	
Appendix A Integration on Manifolds	319
A.1 Differential Forms in $\mathbb{R}^n$	320
A.2 Differential Forms in $\mathbb{C}^n$	325
A.3 Algebraic Topology	326
A.4 Intersection Classes	333
A.5 Residue Forms and the Residue Integral Theorem	336
Notes	338
Exercises	339
