# **PROBLEM EXERCISES FOR GENERAL CHEMISTRY**

# Preface

In writing this *third edition*, we have adhered to our objectives of providing a large number and variety of exercises that are pertinent to almost every general chemistry course, in the style used for examinations in large general chemistry programs and on professional school aptitude examinations—for example MCAT and VCAT. The exercises emphasize the importance of problem-solving, equation writing, and the mastery of notation and symbolism that are the “tools of the chemical trade” and fundamental to the understanding of chemistry.

In this edition we have added ‘Drill Sheets’ throughout the book. These may be assigned as homework to be turned in and graded. Most of the sheets have one or two entries that the professor can furnish data so as to make each homework assignment distinctive from semester to semester. The back sides of these sheets are blank and the professor may ask to show here how a specific problem was calculated, the ‘Set-Up’. In addition, we have expanded upon the material in Chapters 7 and 8, Chemical Reactions.

The following order is generally followed within a chapter: Introduction-to-Subsection, Illustrative Examples on the Subsection, Exercises-on-Subsection. This order is repeated with a chapter for any new topic. Each chapter closes with a large collection of exercises covering the topics of all of the subsections. Answers to all of the exercises are given at the end of the chapter.

An acid-base table, along with acid dissociation constants, and a table of reduction potentials have been included in appropriate chapters; a concise section on significant figures and thermodynamic tables have been included as appendices. The thermodynamic tables have been given not only for the convenience in the use of this book, but also because values do vary somewhat from one book to another. Answers to the exercises are consistent with this tabulated data.

# *Contents*

## **1. INTRODUCTORY CONCEPTS**

### **Units, Conversions between Units, and Significant Figures**

Compendium 1; Examples 4; Exercises 8; Drill 9; Answers 31

### **Matter, Symbols, Formulas, Equations, and the Laws of Chemical Combination**

Compendium 11; Examples 12; Exercises 15; Drill 17; Answers 31

### **Mixtures**

Compendium 19; Examples 20; Exercises 21; Drill 23; Answers 31

### **Energy and Temperature Changes**

Compendium 25; Examples 26; Exercises 27; Answers 31

### **General Exercises**

Exercises 27; Answers 31

## **2. THE MOLE CONCEPT AND ITS USE**

### **Number-Mass-Mole Relationships**

Compendium 32; Examples 33; Exercises 36; Answers 75

### **The Mole Concept—Applications to Pure Substances**

Compendium 37; Examples 39; Exercises 42; Drill 45; Answers 75

### **The Mole Concept—Reaction Stoichiometry**

Compendium 47; Examples 47; Exercises 49; Drill 51, 53; Answers 75

### **The Use of the Mole Concept in Analysis Problems**

Compendium 55; Examples 56; Exercises 57; Answers 75

### **The Mole Concept—Molar Concentration**

Compendium 58; Examples 59; Exercises 62; Drill 63; Answers 75

### **General Exercises—Series 1**

Exercises 65; Answers 75

### **General Exercises—Series 2**

Exercises 70; Answers 75

### **3. ATOMIC STRUCTURE AND THE PERIODIC TABLE**

#### **Fundamental Particles and the Atomic Nucleus**

Compendium 77; Examples 78; Exercises 79; Drill 81; Answers 92

#### **An Introduction to the Periodic Table**

Compendium 80; Exercises 86; Drill 87; Answers 92

### **4. ELECTRONIC STRUCTURE AND THE PERIODIC TABLE**

#### **Electrons in Atoms**

Compendium 93; Example 96; Exercises 97; Drill 99; Answers 111

#### **Periodic Table and Periodicity**

Compendium 98; Exercises 103; Drill 105; Answers 111

#### **General Exercises**

Exercises 107; Answers 111

### **5. GENERAL CONCEPTS OF BONDING AND CHEMICAL NOMENCLATURE**

#### **Simple Ions and Ionic Bonds**

Compendium 112; Example 113; Exercises 114; Drill 115; Answers 143

#### **Covalent Bonds**

Compendium 117; Example 118; Exercises 120; Drill 121; Answers 143

#### **Oxidation Numbers**

Compendium 123; Example 123; Exercises 124; Answers 143

#### **Formulas and Chemical Nomenclature**

Compendium 124–126; Exercises 131; Drill 133; Answers 143

#### **General Exercises**

Exercises 132; Answers 143

### **6. BONDING AND SHAPES OF COVALENT SPECIES**

Compendium 144; Example 148; Exercises 149; Drill 153; Answers 152

### **7. SOLUTION REACTIONS—1**

#### **The Electrolytic Nature of Compounds**

Compendium 155; Drill 157

#### **Acids, Bases and Acid-Base Reactions**

Compendium 160; Example 161; Exercises 167; Answers 185

#### **Lewis Acids and Bases**

Compendium 171; Exercises 172

#### **Oxidation-Reduction Reactions**

Compendium 173; Example 174; Exercises 177; Drill 179; Answers 185

## **Redox Chemistry of Metals and Nonmetals**

Compendium 182; Exercises 184; Answers 185

## **8. SOLUTION REACTIONS—2**

### **Solubility Rules and Precipitation Reactions**

Compendium 187; Exercises 190; Drill 191; Answers 209

### **Titration, Analysis, and Solution Stoichiometry**

Compendium 194; Example 194; Exercises 197; Drill 199; Answers 209

## **9. GASES**

Compendium 211

### **Type 1 Gas Law Problems**

Examples 212; Exercises 214; Answers 232

### **Type 2 Gas Law Problems**

Example 215; Exercises 216; Drill 217; Answers 232

### **Type 3 Gas Law Problems**

Example 216; Exercises 219; Drill 221; Answers 232

### **Gas Laws and Reaction Stoichiometry**

Examples 223; Exercises 224; Drill 225; Answers 232

### **General Exercises**

Exercises 224; Answers 232

## **10. LIQUIDS, SOLIDS, AND CHANGES OF STATE**

### **Liquids and Intermolecular Forces**

Compendium 233; Exercises 234; Answers 250

### **Solids**

Compendium 235; Examples 237; Exercises 238; Drill 239; Answers 250

### **Energetics and Changes of State**

Compendium 241; Example 242; Exercises 243; Answers 250

### **General Exercises**

Exercises 244; Answers 250

## **11. SOLUTIONS**

Compendium 251

### **Concentration Units**

Compendium 252; Examples 253; Exercises 254; Drill 255; Answers 271

### **Colligative Properties**

Compendium 257; Examples 259; Exercises 260; Drill 261; Answers 271

## **General Exercises**

Exercises 263; Answers 271

## **12. CHEMICAL THERMODYNAMICS**

### **Energy, Enthalpy, and Calorimetry**

Compendium 272; Examples 275; Exercises 276; Answers 300

### **Thermochemistry and Hess's Law**

Compendium 277; Examples 280; Exercises 281; Drill 283; Answers 300

### **Entropy, Free Energy, and Reaction Spontaneity**

Compendium 285; Examples 287; Exercises 289; Answers 300

### **General Exercises**

Exercises 291; Answers 300

## **13. REACTION RATES**

### **Concepts and Rate Laws**

Compendium 302; Examples 303; Exercises 305; Drill 307; Answers 319

### **Temperature Dependence and Theory of Reaction Rates**

Compendium 309; Examples 310; Exercises 311; Answers 319

### **General Exercises**

Exercises 313; Answers 319

## **14. CHEMICAL EQUILIBRIUM**

### **The Equilibrium Constant**

Compendium 320; Examples 321; Exercises 323; Answers 342

### **Free Energy and the Equilibrium Constant**

Compendium 328; Examples 330; Exercises 331; Drill 333; Answers 342

### **General Exercises**

Exercises 336; Answers 342; Drill 343

## **15. ACID-BASE REACTIONS AND EQUILIBRIA**

### **Brønsted-Lowry Acids and Bases**

Compendium 345

### **Aqueous Solutions of Strong Acids and Bases—The pH Scale**

Compendium 350; Examples 352; Exercises 353; Answers 386

### **Weak Monoprotic Acids and Bases**

Compendium 354; Examples 355; Exercises 357; Drill 359; Answers 386

### **Reactions of Weak Acids or Bases—Buffers**

Compendium 361; Examples 363; Exercises 365; Drill 371, 373; Answers 386

**Polyprotic Acids**

Compendium 375; Examples 376; Exercises 377; Answers 386

**General Exercises**

Exercises 378; Answers 386

**16. SOLUBILITY AND COMPLEX ION EQUILIBRIA****Solubility and Precipitation Equilibria**

Compendium 387; Examples 388; Exercises 391; Drill 395; Answers 408

**Simultaneous Equilibria**

Compendium 393; Examples 398; Exercises 399; Answers 408

**General Exercises**

Exercises 401; Answers 408

**17. ELECTROCHEMISTRY**

Compendium 409; Examples 411; Drill 413, 419; Table of Reduction Potentials 415; Exercises 417; Answers 428

**General Exercises**

Exercises 423; Answers 428

**18. ORGANIC CHEMISTRY**

Compendium 429; Exercises 433; Answers 437

**APPENDIX TABLES****Selected Values of Standard Thermodynamic Properties at 298.15 K**

Table 439

**Thermodynamic Data for Species in Aqueous Solution**

Table 443

**Standard Enthalpies of Combustion at 298.15 K**

Table 444

**Three-Place Logarithms**

Table 444; Compendium 444

**Reporting Numerical Results**

Compendium 446

# 1

## *Introductory Concepts*

Chemistry is the study of *matter*, the transformations that matter undergoes, and the *energy changes* that accompany these transformations. Such a study requires a wide variety of laboratory measurements. Many of these are similar to ones that you use daily: items purchased at the grocery store may be counted in dozens (measure of *number*) or weighed in pounds or ounces (measure of *mass*); fuel is frequently purchased by the gallon (a measure of *volume*); *linear* measurements are used to express distances between towns (miles) or to indicate the size of a sheet of paper, *e.g.*  $8\frac{1}{2} \times 11$  inches. To express a measured quantity, it is necessary to indicate **both the numerical value and an appropriate unit**. If someone asks a price of 15 (unit unspecified) for an object, it certainly makes a big difference whether the price is 15 dollars or 15 cents. Also, it would be ridiculous to ask the attendant to put 10 acres of gasoline in the tank of an automobile (an inappropriate unit). Indeed, the unit is just as important as the numerical value!

### UNITS, CONVERSIONS BETWEEN UNITS, AND SIGNIFICANT FIGURES

Although we readily recognize units such as gallons and feet, they are not commonly used in most of the rest of the world. The system more widely used throughout the world is the *metric system*, a modified form of which is used in the sciences and is called the *Système International d'Unités* (abbreviated, *SI*). In the SI system seven fundamental units (see Table 1) are defined and all measurements are made by using either these units or units derived directly from them.

Numerical quantities are most conveniently expressed when one or two digits is followed by a decimal point and then an appropriate number of digits beyond the decimal point; thus, 62,500 meters is more conve-

## 2 Chapter 1—Introductory Concepts

TABLE 1. FUNDAMENTAL SI UNITS

Quantity	SI Unit	Symbol	SI/English Conversion Factor
Mass	kilogram*	kg	$\frac{0.4536 \text{ kg}}{1 \text{ pound}}$ or $\frac{453.6 \text{ g}}{1 \text{ pound}}$
Length	meter	m	$\frac{0.02540 \text{ m}}{1 \text{ inch}}$ or $\frac{2.540 \text{ cm}}{1 \text{ inch}}$
Amount	mole	mol	$\frac{\text{number of items}}{6.023 \times 10^{23} \text{ number of items/mole}}$
Time	second	s	The same in both systems
Temperature	kelvin**	K	See p. 133
Electric Current	ampere	A	The same in both systems
Luminous Intensity	candela	cd	The same in both systems

\*For experiments in the laboratory the kilogram usually represents an inconveniently large mass. Laboratory quantities of chemicals are measured in gram quantities; the gram is one-thousandth of a kilogram. \*\*The centigrade (or Celsius) temperature, °C, is also accepted as an alternate to the Kelvin temperature.

TABLE 2. PREFIXES USED AS DECIMAL MULTIPLERS FOR UNITS

Prefix	Abbreviation	Multiplication Factor
exa	E	$10^{18}$
peta	P	$10^{15}$
tera	T	$10^{12}$
giga	G	$10^9$
mega†	M	$10^6$
kilo†	k	$10^3$
deci	d	$10^{-1}$
centi†	c	$10^{-2}$
milli†	m	$10^{-3}$
micro†	$\mu$	$10^{-6}$
nano	n	$10^{-9}$
pico	p	$10^{-12}$
femto	f	$10^{-15}$
atto	a	$10^{-18}$

†Prefixes that are most commonly used in chemistry and should be memorized by the student.

niently expressed by its equivalent 62.5 km. The SI system uses prefixes to indicate large or small quantities. Hence, one thousandth of a gram, 0.001 g, would be more simply expressed as 1 mg. For purposes of comparison with other data, it may be desirable to express this mass as 1,000  $\mu\text{g}$ . All of these refer to exactly the same mass.

## DERIVED UNITS

Upon inspection of Table 1, one notes that no units are specified for the very important quantities *area* and *volume*. This is because suitable units for these can readily be derived by multiplication of fundamental units. Area can be expressed by squaring a linear unit, the meter or the meter with an appropriate prefix. Likewise, volume can be represented by cubing a linear unit; the volume of a cube having 2-cm edges is 8  $\text{cm}^3$  [a  $\text{cm}^3$  is also referred to as a *cubic centimeter (cc)*]. The *liter (L)* has been used as a measure of volume in the metric system for many years and is exactly 1  $\text{dm}^3$ . Due to its wide usage, the liter is an accepted part of the SI. Thus, 1 milliliter (1 mL) is equal to 1  $\text{cm}^3$  (or 1 cc); carry out the arithmetic to check this yourself. With respect to the English system, the liter is just a little larger than a quart; the relationship between these two units is 0.9461 L = 1 quart.

Various other derived units have been developed to describe particular properties of matter. For instance, for comparing the “heaviness” of different substances, *density (d)* is defined as mass per unit volume, which for liquids and solids (in the SI and metric systems) is usually expressed in  $\text{g}/\text{cm}^3$ . Thus, a cube of wood, 2.0 cm on an edge, weighing 6.0131 g, would have a density of:

$$d = \frac{6.0131 \text{ g}}{(2.0 \text{ cm})^3} = 0.75 \text{ g}/\text{cm}^3$$

If the above arithmetic had been carried out on a calculator, one would have obtained additional decimal places, *i.e.* 0.751638. It is necessary to *round off* this number to two *significant figures*, 0.75 (or equivalently, using *exponential* or *scientific notation*, to  $7.5 \times 10^{-1}$ ), so that the calculated answer shows an *accuracy* that is in agreement with the measured numbers. See pp. 349–351 in the Appendix.

A wide variety of important numerical conversions can be made on the basis of a knowledge of the SI and English systems. The successful chemistry student must learn to handle such conversions easily, since the problem-solving techniques are exactly the same as those used in solving many chemical problems. Carefully read the section, “Reporting Numerical Results”, in the Appendix (pp. 446–448) and then study the following example problems, paying particular attention to the units of each factor

## 4 Chapter 1—Introductory Concepts

and how they cancel, as well as the number of significant figures reported in the final answer.

### Example Problems Involving Units, Conversions Between Units, and Significant Figures

#### 1-A. Conversion of Metric Volume to English Volume: The “Factor-Label” or “Unit Conversion” Method

A soft drink bottler distributes its product in 2.00-L bottles. What is the volume in quarts?

- (A) 1.89 qt (B) 2.00 qt (C) 2.11 qt (D) 8.00 qt (E) 9.39 qt

**Solution**      2.00 L  $\rightarrow$  ? qt

This is a metric-to-English volume conversion. In the factor-label (or dimensional-analysis) method of problem solving, the original quantity, 2.00 L, is multiplied by one or more unity factors, cancelling units until the desired unit, quarts, is obtained. A unity factor is a ratio in which the numerator and denominator are equivalent.

In the section, “Derived Units”, the connection, 0.9461 L = 1 qt, was given. By dividing both sides of this relationship by 1 qt, we have the ratio,

$$\frac{0.9461 \text{ L}}{1 \text{ qt}} = 0.9461 \text{ L/qt} = 1;$$

similarly, by dividing both sides by 0.9461 L we obtain the inverse ratio,

$$\frac{1 \text{ qt}}{0.9461 \text{ L}} = 1.057 \text{ qt/L} = 1,$$

as available unity factors. We see that the second of these will permit cancellation of the “L” from 2.00 L, and simultaneously interject “qt” into the numerator.

**Answer**      Thus, (2.00 L) (Unity Factor) = ? qt

$$\text{or} \quad (2.00 \cancel{\text{L}}) \left( \frac{1 \text{ qt}}{0.9461 \cancel{\text{L}}} \right) = 2.11 \text{ qt} \quad [\text{C}]$$

#### 1-B. Mileage-Volume of Gasoline Required: The “Factor-Label” Method

A car is rated with a highway mileage of 41 miles per gallon of gasoline. Given that 1 mile = 1.6093 kilometers, how many liters of gasoline will be needed for a highway trip of 500. kilometers?

- (A) 74 (B)  $3.0 \times 10^3$  (C) 2.0 (D) 5.2 (E) 29

**Solution**

Again, one first writes down the numerical value and the unit(s) of the given condition, here 500. km. Then one writes down the unit(s) required by the answer. Compare these two sets of units, and from other available data, write down the sequence of steps that will be needed. In this case these are:

$$\text{km} \rightarrow \text{mi} \rightarrow \text{gal} \rightarrow \text{qt} \rightarrow \text{L}$$

The steps used will depend upon the unity factors available since each step requires the use of a unity factor. Thus, for our problem, the set-up takes the form:

$$(500. \text{ km}) (\text{Factor A}) (\text{Factor B}) (\text{Factor C}) (\text{Factor D}) = ? \text{ L}$$

It is worth noting that the word “per” used in the problem indicates a division line. The required unity factors are:

$$\left( \frac{1 \text{ mi}}{1.6093 \text{ km}} \right), \left( \frac{41 \text{ mi}}{1 \text{ gal}} \right), \left( \frac{1 \text{ gal}}{4 \text{ qt}} \right), \text{ and } \left( \frac{1 \text{ qt}}{0.9461 \text{ L}} \right).$$

These are now used directly or inverted so that cancellations leave only liters (L) as the final unit. This leads to the set-up:

$$(500. \text{ km}) \left( \frac{1 \text{ mi}}{1.6093 \text{ km}} \right) \left( \frac{1 \text{ gal}}{41 \text{ mi}} \right) \left( \frac{4 \text{ qt}}{1 \text{ gal}} \right) \left( \frac{0.9461 \text{ L}}{1 \text{ qt}} \right) = 29 \text{ L} \quad [\text{E}]$$

**Answer**

If you used a calculator to carry out the indicated arithmetic, the calculator read-out would have been 28.67782235. This answer was rounded off to 2 significant figures so that it would agree in accuracy with the datum (41 mi/gal) used in the calculation. See the section in the Appendix (pp. 349–351) entitled “Reporting Numerical Results” for a discussion of significant figures and rounding off of numbers. Here, the factor, 4 qt/1 gal, is exact to any desired accuracy, *i.e.*, a “defined number”, as opposed to a “measured number”.

**1-C. Conversion of Area in English Units to Metric Units:****The “Factor-Label” Method—Unit Factors****Raised to a Power**

A typical freshman chemistry exam consists of pages measuring  $8\frac{1}{2} \times 11$  inches (or a rather imposing  $93\frac{1}{2}$  square inches, *i.e.*  $93\frac{1}{2} \text{ in}^2$ ). What is the approximate area (reported to one significant figure) of one side of such a page in square meters, *i.e.*  $\text{m}^2$ ?

$$(A) 0.001 \text{ m}^2 \quad (B) 2 \text{ m}^2 \quad (C) 0.01 \text{ m}^2 \quad (D) 0.06 \text{ m}^2 \quad (E) 0.0006 \text{ m}^2$$

**Solution**

If the unity factor relating square meters and square inches were known, all that would be required would be to multiply the given area in square inches by

## 6 Chapter 1 – Introductory Concepts

this unity factor. However, there are no unity factors involving square measure in our table. Some related linear factors that do appear are:

$$\frac{2.540 \text{ cm}}{1 \text{ inch}}, \text{ and } \frac{10^{-2} \text{ m}}{1 \text{ cm}} \text{ or } \frac{100 \text{ cm}}{1 \text{ m}}.$$

Linear unity factors cannot be directly used, but raising any of these to a power generates a new unity factor. Since the problem deals with area, these factors will need to be squared to give unity factors involving area, *i.e.*

$$\left(\frac{2.540 \text{ cm}}{1 \text{ inch}}\right)^2 \text{ and } \left(\frac{10^{-2} \text{ m}}{1 \text{ cm}}\right)^2 \text{ or } \left(\frac{100 \text{ cm}}{1 \text{ m}}\right)^2.$$

Using these factors appropriately, the following steps are needed:

$$\begin{aligned} \text{in}^2 &\rightarrow \text{cm}^2 \rightarrow \text{m}^2 \\ (93.1/2 \text{ in}^2) &\left(\frac{2.540 \text{ cm}}{1 \text{ in}}\right)^2 \left(\frac{1 \text{ m}}{100 \text{ cm}}\right)^2 = 0.060322 \text{ m}^2 \end{aligned}$$

**Alternate Solution.** The result would have been exactly the same if the linear English measurements had first been converted to meters and then multiplied together to get the area in  $\text{m}^2$ . Thus,

$$\left(8.5 \text{ in} \times \frac{2.540 \text{ cm}}{1 \text{ in}} \times \frac{1 \text{ m}}{100 \text{ cm}}\right) \left(11 \text{ in} \times \frac{2.540 \text{ cm}}{1 \text{ in}} \times \frac{10^{-2} \text{ m}}{1 \text{ cm}}\right) = 0.060322 \text{ m}^2$$

### Answer

The first two zeroes are not significant figures, but merely hold the decimal point. Rounding to one significant figure gives  $0.06 \text{ m}^2$  or equivalently  $6 \times 10^{-2} \text{ m}^2$ . (Each page of the chemistry test now looks much less imposing, doesn't it?) [D]

$$\text{You should note that } \left(\frac{2.540 \text{ cm}}{\text{in}}\right)^2 = \frac{(2.540)^2 \text{ cm}^2}{1^2 \text{ in}^2} = \frac{6.452 \text{ cm}^2}{1 \text{ in}^2}.$$

### 1-D. Mass- and Volume-Unit Conversion

The density of lead,  $11.2 \text{ g/cm}^3$ , when expressed in  $\text{lb/ft}^3$  is:

- (A) 2.60 (B) 699 (C) 11.2 (D) 0.179 (E) 0.753

### Solution

$$\begin{aligned} \text{g/cm}^3 &\rightarrow \text{lb/cm}^3 \rightarrow \text{lb/in.}^3 \rightarrow \text{lb/ft}^3 \\ \left(\frac{11.2 \text{ g}}{1 \text{ cm}^3}\right) &\left(\frac{1 \text{ lb}}{453.6 \text{ g}}\right) \left(\frac{2.540 \text{ cm}}{1 \text{ in}}\right)^3 \left(\frac{12 \text{ in}}{1 \text{ ft}}\right)^3 = 699.1813973 \text{ lb/ft}^3 \end{aligned}$$

**Answer**

699 lb/ft<sup>3</sup> (It is rounded off to 3 significant figures, since the original density was given to 3 significant figures.) [B]

**1-E. Volume to Area and Thickness Conversion**

A latex semigloss enamel is advertised as having a coverage of 450. ft<sup>2</sup>/gal when used on sealed surfaces. What is the average thickness of the coat of paint in millimeters?

- (A) 10.1 (B) 188 (C) 0.0905 (D) 0.378 (E) 1.01

**Solution**

$$\begin{aligned}\text{Thickness} &= \frac{\text{Vol}}{\text{Area}} = \frac{\text{gal} \rightarrow \text{qt} \rightarrow \text{L} \rightarrow \text{mL} \rightarrow \text{cm}^3 \rightarrow \text{mm}^3}{\text{ft}^2 \rightarrow \text{in}^2 \rightarrow \text{cm}^2 \rightarrow \text{mm}^2} \\ &= \frac{\left(1 \text{ gal}\right) \left(4 \frac{\text{qt}}{\text{gal}}\right) \left(0.946 \frac{\text{L}}{\text{qt}}\right) \left(10^3 \frac{\text{mL}}{\text{L}}\right) \left(1 \frac{\text{cm}^3}{\text{mL}}\right) \left(10 \frac{\text{mm}}{\text{cm}}\right)^3}{\left(450 \text{ ft}^2\right) \left(12 \frac{\text{in}}{\text{ft}}\right)^2 \left(2.540 \frac{\text{cm}}{\text{in}}\right)^2 \left(10 \frac{\text{mm}}{\text{cm}}\right)^2} \\ &= 0.0905125267 \text{ mm}\end{aligned}$$

**Answer**

0.0905 mm (3 significant figures). The accuracy implied is 1 part in 905, or about 0.1%. This is comparable in order of magnitude to the accuracy indicated in the data, *i.e.*, the area ( $\sim 0.2\%$ ) and in the qt  $\rightarrow$  L conversion factor ( $\sim 0.1\%$ ). [C]

**1-F. Significant Figures in Addition, Subtraction, and Division**

A mixture is prepared by mixing 7.65 g of A and 6.95 g of B. The total weight of the mixture can be reported to \_\_\_\_\_ significant figures; the ratio, wt of A/wt of B, in the mixture can be reported to \_\_\_\_\_ significant figures; and the difference, A - B, can be reported to \_\_\_\_\_ significant figures. The numbers required to fill the blanks are, respectively,

- (A) 3, 3, 3 (B) 4, 3, 2 (C) 4, 3, 3 (D) 4, 4, 3 (E) None of these

**Solution**

In the summation, both weights are known to the nearest 0.01 g; therefore the sum, 14.60 g, is likewise known to the hundredths place, and one significant figure has been gained in the addition. In the ratio, the quotient,  $7.65/6.95 = 1.100719424$ , must be rounded to 1.10, or 3 significant figures. The difference, 0.70 g, is also good to the hundredths place, but contains only two significant figures due to the loss of the units place in the subtraction.
