RAVEN, BIOLOGY, 7/E

Chapter 1

Hierarchical organization of living things	
Figure 1.2	1
Deductive reasoning: How Eratosthenes estimated the circumference of the earth using deductive reasoning	2
Figure 1.3	2
How science is done	3
Figure 1.4	4
Charles Darwin	4
Figure 1.5	4
The five-year voyage of H.M.S. <i>Beagle</i>	4
Figure 1.6	4
Fossil evidence of evolution	5
Figure 1.8	5
Four Galápagos finches and what they eat	5
Figure 1.9	5
Geometric and arithmetic progressions	6
Figure 1.10	6
An excerpt from Charles Darwin's <i>On the Origin of Species</i>	6
Figure 1.11	6
Darwin greets his monkey ancestor	7
Figure 1.12	7
Homology among vertebrate limbs	8
Figure 1.13	8
Molecules reflect evolutionary patterns	9
Figure 1.14	9
The molecular clock of cytochrome <i>c</i>	9
Figure 1.15	9
Genes are made of DNA	10
Figure 1.17	10
The diversity of life	11
Figure 1.18	11
Tree of homeodomain proteins	12
Figure 1.19	12

Chapter 2

Basic structure of atoms	
Figure 2.2	10
The three most abundant isotopes of carbon	10
Figure 2.3	10
Electron orbitals	11
Figure 2.4	11
Atomic energy levels	12
Figure 2.5	12
Oxidation and reduction	12
Figure 2.6	12
Electron energy levels for helium and nitrogen	13
Figure 2.7	13
Periodic table of the elements	14
Figure 2.8	14
The formation of ionic bonds by sodium chloride	13
Figure 2.9	14
Hydrogen gas	14
Figure 2.10	14
Water has a simple molecular structure	
Figure 2.12	14

Structure of a hydrogen bond	Figure 2.13	14
The Properties of Water	Table 2.1	15
Capillary action	Figure 2.15	15
The role of hydrogen bonds in an ice crystal	Figure 2.16	15
Why salt dissolves in water	Figure 2.17	16
The pH scale	Figure 2.18	16
Buffers minimize changes in pH	Figure 2.19	17
Buffer formation	Figure 2.20	17

Chapter 3

The primary functional chemical groups	
Figure 3.2	18
Macromolecules Table 3.1	19
Making and breaking macromolecules	
Figure 3.3	19
Polymer Macromolecules Table 3.2	20
The Many Functions of Proteins Table 3.3	21
The peptide bond Figure 3.5	22
The 20 common amino acids Figure 3.6	23
Interactions that contribute to a protein's shape Figure 3.7	24
Six levels of protein structure Figure 3.8	25
How one type of chaperone protein works	
Figure 3.9	26
Protein denaturation Figure 3.10	26
Primary structure determines tertiary structure Figure 3.11	27
The first photograph of a DNA molecule	
Figure 3.12	27
Structure of a nucleotide Figure 3.14	28
The structure of a nucleic acid and the organic nitrogen-containing bases Figure 3.15	28
The structure of DNA Figure 3.16	29
DNA versus RNA Figure 3.17	30
ATP Figure 3.18	30
Phospholipids Figure 3.19	31
Lipids spontaneously form micelles or lipid bilayers in water Figure 3.20	31
Other kinds of lipids Figure 3.21	32
Saturated and unsaturated fats Figure 3.22	32
Monosaccharides Figure 3.23	33
Structure of the glucose molecule	
Figure 3.24	33
Disaccharides Figure 3.25	34
Isomers and stereoisomers Figure 3.26	34

How disaccharides form	Figure 3.27	35	Viewing a plasma membrane with freeze-fracture microscopy	Figure 6.6	62
Polymers of glucose	Figure 3.28	35	Functions of plasma membrane proteins	Figure 6.7	63
Chapter 4			How nonpolar regions lock proteins into membranes	Figure 6.8	64
The Miller-Urey experiment	Figure 4.6	36	Linking proteins	Figure 6.9	64
Results of the Miller-Urey experiment	Figure 4.7	37	A channel protein	Figure 6.10	65
A current bubble hypothesis	Figure 4.8	38	A pore protein	Figure 6.11	65
Origin of the nucleus and endoplasmic reticulum	Figure 4.13	38	Diffusion	Figure 6.12	66
The theory of endosymbiosis	Figure 4.14	39	Facilitated diffusion is a carrier-mediated transport process	Figure 6.13	66
Geologic timescale and the evolution of the kingdoms of life	Figure 4.16	40	Osmosis	Figure 6.14	67
			How solutes create osmotic pressure	Figure 6.15	67
Chapter 5			Endocytosis	Figure 6.16	68
A generalized eukaryotic cell	Figure 5.2	41	Exocytosis	Figure 6.17	69
Surface area-to-volume ratio	Figure 5.3	41	The sodium-potassium pump	Figure 6.18	69
The size of cells and their contents	Figure 5.4	42	Coupled transport	Figure 6.19	70
Structure of a prokaryotic cell	Figure 5.5	42	Mechanisms for Transport Across Cell Membranes	Table 6.2	71
Prokaryotes swim by rotating their flagella	Figure 5.6	43	Chapter 7		
Structure of an animal cell	Figure 5.8	44	Four kinds of cell signaling	Figure 7.2	72
Structure of a plant cell	Figure 5.9	45	Basic structure of a gene-regulating intracellular receptor	Figure 7.3	72
The nucleus	Figure 5.10	46	Cell-Communicating Mechanisms	Table 7.1	73
Nucleosomes	Figure 5.11	47	How intracellular receptors regulate gene transcription	Figure 7.4	74
Eukaryotic Cell Structures and Their Functions	Table 5.2	48	Cell surface receptors	Figure 7.5	75
The endoplasmic reticulum	Figure 5.13	49	The G-protein-linked receptor	Figure 7.6	75
Signal sequences direct proteins to their destinations in the cell	Figure 5.14	49	Structure of the β -adrenergic receptor	Figure 7.7	76
The Golgi apparatus	Figure 5.15	50	How second messengers work	Figure 7.8	76
How proteins are transported within the cell	Figure 5.16	51	Calmodulin	Figure 7.9	77
Lysosomes	Figure 5.17	52	Signal amplification	Figure 7.10	78
A ribosome	Figure 5.19	52	The role of signal amplification in vision	Figure 7.11	79
Mitochondria	Figure 5.21	53	Structure of the immunoglobulin family of cell surface marker proteins	Figure 7.12	80
Chloroplast structure	Figure 5.22	53	An overview of cell junction types	Figure 7.13	81
Endosymbiosis	Figure 5.23	54	The three types of cell junctions	Figure 7.14	82
Molecules that make up the cytoskeleton	Figure 5.24	54	Desmosomes	Figure 7.15	83
Centrioles	Figure 5.25	55	A cadherin-mediated junction	Figure 7.16	83
Molecular motors	Figure 5.26	55	Gap junctions	Figure 7.17	84
Flagella and cilia	Figure 5.27	56	Plasmodesmata	Figure 7.18	84
The central vacuole	Figure 5.28	56	Chapter 8		
Cell walls in plants	Figure 5.29	57	Potential and kinetic energy	Figure 8.2	85
The extracellular matrix	Figure 5.30	57	Oxidation-reduction reactions often employ cofactors	Figure 8.3	85
A Comparison of Prokaryotic, Animal, and Plant Cells	Table 5.3	58	Redox reactions	Figure 8.4	86
			Energy in chemical reactions	Figure 8.6	86
			Activation energy and catalysis	Figure 8.7	87
			Catalysis: A Closer Look at Carbonic Anhydrase	Figure 8.A	87
Chapter 6					
Phospholipid structure	Figure 6.2	59			
A phospholipid bilayer	Figure 6.3	59			
Protein movement in membranes	Figure 6.4	60			
The fluid mosaic model of cell membranes	Figure 6.5	60			
Components of the Cell Membrane	Table 6.1	61			

The active site of the enzyme lysozyme Figure 8.8	88	Converting light to chemical energy Figure 10.11	114
The catalytic cycle of an enzyme Figure 8.9	88	The path of an electron in sulfur bacteria Figure 10.12	115
The enzyme pyruvate dehydrogenase Figure 8.10	89	The enhancement effect Figure 10.13	115
Enzyme sensitivity to the environment Figure 8.11	89	A Z diagram of photosystems I and II Figure 10.14	116
How enzymes can be inhibited Figure 8.12	90	The photosynthetic electron transport system Figure 10.15	117
The chemical structure of nicotinamide adenine dinucleotide (NAD ⁺) Figure 8.13	90	Chemiosmosis in a chloroplast Figure 10.16	118
The ATP molecule Figure 8.14	91	How the Calvin cycle works Figure 10.17	119
A biochemical pathway Figure 8.15	91	The Calvin cycle in detail Figure 10.18	120
Feedback inhibition Figure 8.16	92	Chloroplasts and mitochondria: Completing an energy cycle Figure 10.19	121
Chapter 9		Conditions favoring photorespiration Figure 10.20	121
Structure of the ATP molecule Figure 9.2	92	Carbon fixation in C ₄ plants Figure 10.21	122
ATP synthase at work Figure 9.3	93	Photosynthetic ETS from quiz questions TA 10.1	122
Substrate-level phosphorylation Figure 9.4	93		
An overview of aerobic respiration Figure 9.5	94	Chapter 11	
How glycolysis works Figure 9.6	95	Binary fission Figure 11.2	123
The glycolytic pathway Figure 9.7	96	A comparison of protein assemblies during cell division among different organisms Figure 11.4	124
What happens to pyruvate, the product of glycolysis? Figure 9.8	97	Chromosome Number in Selected Eukaryotes Table 11.1	125
The oxidation of pyruvate Figure 9.10	98	Levels of eukaryotic chromosomal organization Figure 11.6	125
How the Krebs cycle works Figure 9.11	99	The difference between homologous chromosomes and sister chromatids Figure 11.8	126
The Krebs cycle Figure 9.12	100	The cell cycle Figure 11.9	126
How electron transport works Figure 9.13	101	Kinetochores Figure 11.10	127
NAD ⁺ and NADH Figure 9.14	101	Metaphase Figure 11.11	127
The electron transport chain Figure 9.15	102	Mitosis and cytokinesis in plants and animals Figure 11.12	128
Chemiosmosis Figure 9.16	102	Cytokinesis in plant cells Figure 11.15	129
ATP generation during the Krebs cycle and electron transport chain Figure 9.17	103	Control of the cell cycle Figure 11.16	130
Theoretical ATP yield Figure 9.18	104	A complex of two proteins triggers passage through cell cycle checkpoints Figure 11.17	130
Control of glucose catabolism Figure 9.19	105	Checkpoints of the cell cycle Figure 11.18	131
How cells extract chemical energy Figure 9.20	106	The cell proliferation-signaling pathway Figure 11.19	132
Deamination Figure 9.21	106	Cell division and p53 protein Figure 11.20	133
β oxidation Figure 9.22	107	Key proteins associated with human cancers Figure 11.21	133
Fermentation Figure 9.23	108	Mitosis and cell cycle figure from quiz questions TA 11.1	134
Chapter 10		Chapter 12	
Journey into a leaf Figure 10.2	109	Diploid cells carry chromosomes from two parents Figure 12.2	134
Discovery of the light-independent reactions Figure 10.3	110	Three types of sexual life cycles Figure 12.3	135
The electromagnetic spectrum Figure 10.4	111	The sexual life cycle in animals Figure 12.4	135
The absorption spectrum of chlorophyll and carotenoids Figure 10.5	111		
Chlorophyll Figure 10.6	112		
Constructing an action spectrum for photosynthesis Figure 10.7	112		
Fall colors are produced by carotenoids and other accessory pigments Figure 10.8	113		
Emerson and Arnold's experiment Figure 10.9	113		
How the antenna complex works Figure 10.10	114		

Unique features of meiosis Figure 12.5	136	The first genetic map Figure 13.32	157
A comparison of meiosis and mitosis Figure 12.6	137	The human X chromosome gene map Figure 13.33	158
The results of crossing over Figure 12.8	138	A human karyotype Figure 13.34	159
Chiasmata created by crossing over have a key impact on how chromosomes align in metaphase I Figure 12.9	138	Sex Determination in Some Organisms Table 13.4	159
Random orientation of chromosomes on the metaphase plate Figure 12.10	139	Down syndrome Figure 13.35	160
The stages of meiosis Figure 12.11	140	Correlation between maternal age and the incidence of Down syndrome Figure 13.36	160
Independent assortment increases genetic variability Figure 12.13	142	How nondisjunction can produce abnormalities in the number of sex chromosomes Figure 13.37	161
Life cycle from quiz questions TA 12.1	142	Amniocentesis Figure 13.38	161
Chapter 13		Dihybrid cross from quiz questions TA 13.1	162
Structure of the pea flower (longitudinal section) Figure 13.7	143	Dihybrid cross from genetics problems TA 13.2	162
How Mendel conducted his experiments Figure 13.8	143	Chapter 14	
Seven Characteristics Mendel Studied and His Experimental Results Table 13.1	144	Hammerling's <i>Acetabularia</i> reciprocal graft experiment Figure 14.2	163
The F ₂ generation is a disguised 1:2:1 ratio Figure 13.11	145	Nuclear transplant experiment Figure 14.3	163
Some Dominant and Recessive Traits in Humans Table 13.2	146	Griffith's discovery of transformation Figure 14.4	164
A Punnett square Figure 13.12	147	The Hershey-Chase experiment Figure 14.5	164
Mendel's cross of pea plants differing in flower color Figure 13.13	148	Nucleotide subunits of DNA and RNA Figure 14.6	165
A testcross Figure 13.14	148	Numbering the carbon atoms in a nucleotide Figure 14.7	165
Binomial Distribution of the Sexes of Children in Human Families Table 13.A	149	Chargaff's Analysis of DNA Nucleotide Base Compositions Table 14.1	166
Analyzing a dihybrid cross Figure 13.15	149	A phosphodiester bond Figure 14.8	166
Height is a continuously varying trait Figure 13.16	150	Rosalind Franklin's X-ray diffraction patterns Figure 14.9	167
Incomplete dominance Figure 13.17	150	The DNA double helix Figure 14.10	168
How epistasis affects grain color Figure 13.19	151	The key result of the Meselson-Stahl experiment Figure 14.11	168
The effect of epistatic interactions on coat color in dogs Figure 13.20	152	The Meselson-Stahl experiment: evidence demonstrating semiconservative replication Figure 14.12	169
Multiple alleles control the ABO blood groups Figure 13.21	152	Origins of replication Figure 14.13	170
The Royal hemophilia pedigree Figure 13.23	153	How nucleotides are added in DNA replication Figure 14.14	170
The sickle cell allele increases resistance to malaria Figure 13.25	153	Synthesis of the leading and lagging strands Figure 14.15	171
Some Important Genetic Disorders Table 13.3	154	A DNA replication fork Figure 14.16	171
Using AAV to cure canine retinal degeneration Figure 13.27	154	DNA Replication Enzymes of <i>E. coli</i> Table 14.2	172
Morgan's experiment demonstrating the chromosomal basis of sex linkage in <i>Drosophila</i> Figure 13.29	155	The DNA polymerase III complex Figure 14.17	172
Stern's experiment demonstrating the physical exchange of chromosomal arms during crossing over Figure 13.30	156	How DNA polymerase III works Figure 14.18	173
The chromosomal locations of the seven genes studied by Mendel in the garden pea Figure 13.31	157	Eukaryotic chromosomes possess numerous replication forks spaced along their length Figure 14.20	173

Beadle and Tatum's procedure for isolating nutritional mutants in <i>Neurospora</i> Figure 14.21	174	Stage 4-II: Using hybridization to identify the gene of interest Figure 16.10	191
Evidence for the "one-gene/one-polypeptide" hypothesis Figure 14.22	174	The polymerase chain reaction Figure 16.11	192
The molecular basis of a hereditary disease Figure 14.23	175	The Southern blot procedure Figure 16.12	193
Chapter 15		The hybridization step in Southern blot procedure Figure 16.13	194
A ribosome is composed of two subunits Figure 15.2	175	Restriction fragment length polymorphism (RFLP) analysis Figure 16.14	194
The structure of tRNA Figure 15.4	176	Diseases Being Treated in Clinical Trials of Gene Therapy Table 16.1	195
The Central Dogma of gene expression Figure 15.5	176	Strategy for constructing a subunit vaccine for herpes simplex Figure 16.18	195
Using frameshift alterations of DNA to determine if the genetic code is punctuated Figure 15.6	177	The Ti plasmid Figure 16.19	196
The Genetic Code Table 15.1	177	Transgenic rice Figure 16.21	196
Initiation of transcription by the σ subunit Figure 15.8	178	The production of bovine somatotropin (BST) through genetic engineering Figure 16.22	197
Model of a transcription bubble Figure 15.9	178	Calvin and Hobbes TA 16.1	197
A GC hairpin Figure 15.10	178	Formation of cDNA from quiz questions TA 16.2	198
Eukaryotic initiation complex Figure 15.11	179	Chapter 17	
Posttranscriptional modifications Figure 15.12	179	<i>Haemophilus influenzae</i> genome Figure 17.1	198
Translation in action Figure 15.13	180	Restriction enzymes can be used to create a physical map Figure 17.2	199
Activating enzymes "read" the genetic code Figure 15.14	180	Creating a physical map with sequence-tagged sites Figure 17.3	200
Formation of the initiation complex Figure 15.15	180	Sequencing DNA Figure 17.5	200
Translocation Figure 15.16	181	Comparison of sequencing methods Figure 17.6	201
Termination of protein synthesis Figure 15.17	181	Size and complexity of genomes Figure 17.7	201
The eukaryotic ovalbumin gene is fragmented Figure 15.18	182	Alternative splicing can result in the transcription of different mRNAs from the same coding sequence Figure 17.8	202
How spliceosomes process RNA Figure 15.19	182	Classes of DNA Sequences Found in the Human Genome Table 17.1	202
An overview of gene expression in eukaryotes Figure 15.20	183	Grain genomes are rearrangements of similar chromosome segments Figure 17.9	203
Gene information is processed differently in prokaryotes and eukaryotes Figure 15.21	184	Microarrays Figure 17.10	204
DNA structure from quiz questions TA 15.1	184	High-Priority Pathogens for Genomic Research Table 17.2	204
Chapter 16		Chapter 18	
Many restriction endonucleases produce DNA fragments with "sticky ends" Figure 16.2	185	Reading the major groove of DNA Figure 18.2	205
Using plasmid and phage vectors Figure 16.3	186	The helix-turn-helix motif Figure 18.3	205
One of the first genetic engineering experiments Figure 16.4	187	How the helix-turn-helix binding motif works Figure 18.4	206
Creating DNA libraries Figure 16.5	187	Major DNA-binding motifs Figure 18.5	207
The formation of cDNA Figure 16.6	188	The <i>lac</i> region of the <i>Escherichia coli</i> chromosome Figure 18.6	208
Gel electrophoresis Figure 16.7	189	How the <i>trp</i> operon is controlled Figure 18.7	208
Stages in a genetic engineering experiment Figure 16.8	190		
Stage 4-I: Identifying recombinant clones Figure 16.9	191		

How the tryptophan repressor works Figure 18.8	209	Hayflick's experiment, blank graph from quiz questions TA 19.1	235
How the <i>lac</i> repressor works Figure 18.9	209		
How CAP works Figure 18.10	210	Chapter 20	
How the CAP site works Figure 18.11	210	Excision and integration of a plasmid Figure 20.2	236
Two regulatory proteins control the <i>lac</i> operon Figure 18.12	211	Gene transfer between bacteria Figure 20.4	236
A eukaryotic promoter Figure 18.13	211	A conjugation map of the <i>E. coli</i> chromosome Figure 20.5	237
Formation of a eukaryotic initiation complex Figure 18.14	212	Transposon Figure 20.6	237
An enhancer in action Figure 18.15	212	Transposition Figure 20.7	237
How enhancers work Figure 18.16	213	Unequal crossing over Figure 20.8	238
Interactions of various factors within the transcription complex Figure 18.17	214	Types of Mutation Table 20.1	238
Nucleosomes Figure 18.18	215	The consequence of inversion Figure 20.9	239
DNA methylation Figure 18.19	216	Portrait of a cancer Figure 20.11	239
Small RNAs form double-stranded loops Figure 18.20	216	Incidence of Cancer in the United States in 2002 Table 20.2	240
How small RNAs may act to regulate gene expression Figure 18.21	217	The Ames test Figure 20.12	241
Alternative splicing products Figure 18.22	218	Chemical Carcinogens in the Workplace Table 20.3	242
Six levels where gene expression can be controlled in eukaryotes Figure 18.23	219	The main classes of oncogenes Figure 20.13	243
Regulatory proteins control the <i>lac</i> operon from quiz questions TA 18.1	220	Some Genes Implicated in Human Cancers Table 20.4	244
		How the tumor-suppressor genes <i>Rb</i> and <i>p16</i> interact to block cell division Figure 20.14	245
Chapter 19		The role of tumor-suppressor <i>p53</i> in regulating the cell cycle Figure 20.15	246
Four developmental systems Figure 19.2	221	The progression of mutations that commonly lead to colorectal cancer Figure 20.16	246
The path of vertebrate development Figure 19.5	222	The annual death rate from cancer climbs with age Figure 20.17	247
The fruit fly, <i>Drosophila melanogaster</i> Figure 19.6	223	Smoking causes cancer Figure 20.19	247
The path of insect development Figure 19.7	224	Tobacco reduces life expectancy Figure 20.20	248
The path of plant development Figure 19.8	225	The incidence of lung cancer in men and women Figure 20.21	248
Studying development in the nematode Figure 19.9	226	Potential targets for cancer therapies Figure 20.22	249
Development of the vertebrate eye by induction Figure 19.10	226	Wilmut's animal cloning experiment Figure 20.23	250
An organizer creates a morphogen gradient Figure 19.11	227	Using embryonic stem cells to restore damaged tissue Figure 20.25	250
Fate of cells in an early <i>Xenopus</i> embryo Figure 19.12	227	How human embryos might be used for therapeutic cloning Figure 20.26	252
Constructing a chimeric mouse Figure 19.13	228	Pluripotent stem cells Figure 20.27	252
Proof that determination is reversible Figure 19.14	229	The Ethics of Stem Cell Research Table 20.5	254
Body organization in an early <i>Drosophila</i> embryo Figure 19.15	230		
Mutations in homeotic genes Figure 19.17	231	Chapter 21	
<i>Drosophila</i> homeotic genes Figure 19.18	231	Two ideas of how giraffes might have evolved long necks Figure 21.2	255
Homeodomain protein Figure 19.19	232	The Hardy-Weinberg equilibrium Figure 21.4	255
A comparison of homeotic gene clusters in the fruit fly <i>Drosophila melanogaster</i> and the mouse <i>Mus musculus</i> Figure 19.20	233	Agents of Evolutionary Change Table 21.1	256
Programmed cell death Figure 19.21	234		
Gompertz curves Figure 19.22	234		
Hayflick's experiment Figure 19.23	235		

Five agents of evolutionary change Figure 21.5	256	Evolutionary change in body size of horses Figure 22.15	271
Genetic drift: A bottleneck effect Figure 21.6	257	Evolutionary trends in horses through time Figure 22.16	272
Pocket mice from the Tularosa Basin of New Mexico whose color matches their background Figure 21.7	257	Homology of the bones of the forelimb of mammals Figure 22.17	273
Selection to match climatic conditions Figure 21.8	258	The eyes of vertebrates and mollusks Figure 22.18	273
Selection for pesticide resistance Figure 21.9	258	Vestigial structures Figure 22.19	274
Body size and egg-laying in water striders Figure 21.10	259	Molecules reflect evolutionary divergence Figure 22.20	274
Degree of copper tolerance in grass plants on and near ancient mine sites Figure 21.11	260	Convergent evolution Figure 22.21	275
Frequency-dependent selection Figure 21.12	260	Chapter 23	
Frequency of sickle cell allele and distribution of <i>Plasmodium falciparum</i> malaria Figure 21.13	261	Geographic variation in the milk snake, <i>Lampropeltis triangulum</i> Figure 23.2	276
Three kinds of selection Figure 21.14	261	Reproductive Isolating Mechanisms Table 23.1	277
Disruptive selection for large and small beaks Figure 21.15	262	Differences in courtship song of sympatric species of lacewings Figure 23.5	278

Chapter 47

Different types of chemical messengers	
Figure 47.2	545
The human endocrine system	546
Figure 47.3	
Principal Endocrine Glands and	
Their Hormones	547
Table 47.1	
Chemical structures of some steroid	
hormones	549
Figure 47.4	
The mechanism of steroid hormone action	
Figure 47.5	549
The mechanism of thyroxine action	
Figure 47.6	550
The action of epinephrine on a liver cell	
Figure 47.7	550
The IP_3/Ca^{++} second-messenger system	
Figure 47.8	551
The effects of antidiuretic hormone (ADH)	
Figure 47.9	551
The major hormones of the anterior	
and posterior pituitary glands	
Figure 47.10	552
Hormonal control of the anterior pituitary	
gland by the hypothalamus	552
Figure 47.12	
Negative feedback inhibition	
Figure 47.13	553
Regulation of thyroxine secretion	
Figure 47.14	553
Thyroxine triggers metamorphosis in	
amphibians	554
Figure 47.16	
Regulation of blood Ca^{++} levels by	
parathyroid hormone (PTH)	
Figure 47.17	555
The adrenal glands	555
Figure 47.18	
The antagonistic actions of insulin and	
glucagon on blood glucose	556
Figure 47.19	
The hormonal control of metamorphosis	
in the silkworm moth, <i>Bombyx mori</i>	
Figure 47.21	557
Regulation of thyroxine secretion from	
quiz questions	557
TA 47.1	

Chapter 48

The lymphatic system	558
Figure 48.2	
How natural killer cells kill target cells	
Figure 48.4	558
How complement creates a hole in a	
cell membrane	559
Figure 48.5	
The events in a local inflammation	
Figure 48.6	559
Cells of the Immune System	560
Table 48.1	
Key Cell Surface Proteins of the Immune	
System	561
Table 48.2	
The T cell immune defense	561
Figure 48.8	
Cytotoxic T cells destroy cancer cells	
Figure 48.9	562
The B cell immune defense	563
Figure 48.10	
Five Classes of Immunoglobulins	
Table 48.3	564
IgM and IgG antibodies	564
Figure 48.11	

The structure of an antibody molecule	
Figure 48.12	565
Structure of an antibody as a B cell receptor	
Figure 48.13	565
The lymphocyte receptor molecule is	
produced by a composite gene	
Figure 48.14	566
The development of active immunity	
Figure 48.15	566
The clonal selection theory of active	
immunity	567
Figure 48.16	
Overview of the specific immune response	
Figure 48.17	568
The production of monoclonal antibodies	
Figure 48.19	569
Using monoclonal antibodies to detect	
an antigen	569
Figure 48.20	
Discovering the cellular immune response	
in invertebrates	570
Figure 48.21	
How immune systems evolved	
Figure 48.22	570
HIV, the virus that causes AIDS	
Figure 48.23	571
Survival of T cells in culture after	
exposure to HIV	571
Figure 48.24	
The AIDS epidemic in the United States:	
New cases	572
Figure 48.25	
An allergic reaction	573
Figure 48.26	

Chapter 49

A generalized diagram of a negative	
feedback loop	573
Figure 49.2	
Negative feedback loops keep the body	
temperature within a normal range	
Figure 49.3	574
Thermoregulation in insects	
Figure 49.4	575
The negative feedback control of blood	
glucose	575
Figure 49.5	
Room temperature is maintained by	
antagonistic effectors	576
Figure 49.6	
Positive feedback during childbirth	
Figure 49.7	576
The interaction between intracellular	
and extracellular compartments of the	
body and the external environment	
Figure 49.8	577
The protonephridia of flatworms	
Figure 49.9	578
The nephridia of annelids	578
Figure 49.10	
The Malpighian tubules of insects	
Figure 49.11	579
Organization of the vertebrate nephron	
Figure 49.12	580
Freshwater and marine teleosts face different	
osmotic problems	581
Figure 49.13	
How marine birds cope with excess salt	
Figure 49.14	582
Nitrogenous wastes	582
Figure 49.15
