# Preface

It is an inconceivable phenomenon that atmospheric acoustics, a discipline with such importance and long history had no monograph contributed to the field. This situation was not changed until 1997, when the first Chinese edition of Atmospheric Acoustics was published by Science Press. Hereafter, quite a few publishers expressed their interests in publishing its English version. Some “sample chapters” were reviewed and approved by expert-group and earned favourable comments. However, all projects miscarried purely due to the duty-dereliction of some staff members there.

The second Chinese edition was published in 2007, with many new material been added. Some supplements, mainly in Chapter 10, were completed by Prof. Chen Yu at Tsinghua University. Couple of years later Dr. Bao Ming and my other young colleagues at The Institute of Acoustics, Chinese Academy of Sciences, suggested to restart the plan to publish an English version. Subsequently a publishing agreement was reached between the German publishing house De Gruyter and the Science Press.

This English version is based on the translation from the 2<sup>nd</sup> Chinese edition. Thanks to Zhao Nan, Ao Lin and Lin Jianheng for their translating drafts of the corresponding parts of this book.

Though there is no other book subjected to atmospheric acoustics till now, several similar publications existed indeed. Some related contents from these publications were utilized in writing this book, which are indicated at the right places separately.

The foundation for writing this book is basing on the author’s thirty-year experiences of researching atmospheric acoustics. The main aim of this book is to give the readers fundamental understandings concerning this very field. Though both theoretical and experimental materials have been presented, the former is dominant.

# Foreword

Acoustics is a branch of physics with distinctive features. Firstly, it is one of the earliest developed branches in the physical sciences. In ancient times, whether in China, the Orient, Greece or in the occident, people understood the basic concepts of “sound” without diversions—to this point, acoustics is much more fortunate as compared to its companion discipline, optics. As a systematic sub-branch, its fundamental theory was developed to a quite perfect level by the middle of the 19th century, the “golden age” of classical physics. Secondly, acoustics is also the most active branch of physics today. Owing to the interlocking connections with so many fields, involving not only almost all of the main fundamental natural sciences (including life sciences) but also some humanities studies, many corresponding frontiers have been formed. Presently the number of sub-branches exceeds twenty, and additional sub-branches continuously grow with each passing year. Such a position is very rare in other branches of physics, and indeed even in the whole scope of natural sciences.

Among the sub-branches of acoustics, atmospheric acoustics turns out to be one of the most ancient and most important ones. As early as the beginning of the 18th century, acoustics was preliminarily formed as a discipline, and in the 19th century a lot of important fundamental phenomena had been studied, with the corresponding theories reaching a quite mature level. Thereafter, research work in this field proceeded uninterrupted, and great developments have been achieved in recent years. As the material on which humanity relies for its existence, and as one of the three vast media (along with the oceans and the earth’s crust) through which sound waves can propagate through, the atmosphere embodies numerous and varied wave phenomena. Humanity would do well to develop a thorough understanding of the basic nature of wave phenomena, which are closely related to many other natural phenomena and human activities. Thus it is argued that atmospheric acoustics is not only an important fundamental discipline, but also an important applied one.

However, what puzzles people is the fact that there was not a monograph or book devoted to such an important and peculiar discipline in the worldwide literature until now. There are two books of a similar nature, i.e., T. Beer’s *Atmospheric Waves* and E. E. Gossard & W. H. Hooke’s *Waves in the Atmosphere* (references [32] and [208] in this book). As shown by their names, however, they do not belong solely to the category of atmospheric acoustics. Needless to say any monograph, or

even general texts regarding acoustics with contents concerning atmospheric acoustics, are scarcely found. A. D. Pierce's *Acoustics: An Introduction to Its Physical Principles and Applications* (reference [60]) is perhaps the only exception. Besides, there are merely a couple of reviews, such as the paper *Advances in Atmospheric Acoustics* written by E. H. Brown & F. F. Hall, Jr.(reference [2]) plus items in some encyclopedias of science and technology, such as those written by H. E. Bass (reference [180]) and by E. H. Brown, respectively. All the above-mentioned material have been of great instructive help in the writing of this book, and the content in several sections and/or chapters are quoted directly from them.

In view of the above-mentioned situations, to publish a high-level monograph of atmospheric acoustics thus becomes a task of top priority for filling in the gaps in this very field. This book is nothing but an attempt for “casting a brick to attract jade”<sup>1)</sup>. The aim is to provide readers with a systematic and rigorous “general picture” that reflects the highest academic level in this field, and is as up-to-date and as is fully possible. Consideration has been given to both theory and practice, though particular emphasis has been placed on the former. Special attention was paid to the discussion of fundamental concepts and the treatment of physical processes. As for mathematical derivations, we did not want to go too far, as the crux of the matter is pointing out the “origin and development” rather than rigidly adhering to “rigorousness”.

In this book, essential descriptions of structural properties and acoustical behaviors of the atmosphere as a propagation medium of sound waves will be given first. Then, based on fundamental equations of fluid dynamics, combined with the practice of the medium atmosphere, a series of acoustic wave processes such as reflection, refraction, scattering, diffraction and absorption are discussed. Therein, alternative methods of wave acoustics and geometric acoustics are used in accordance with different situations. Regarding the discussion of influences from the earth’s gravity field and rotation, we transit from “classical atmospheric acoustics” to “modern atmospheric acoustics”. In order to make the discussion more coherent and more comprehensive, some fundamental acoustic relations were derived in detail. Just through the description of these processes, an understanding of atmospheric acoustics is established. In the chapter on “computational atmospheric acoustics”, some further treatment of basic problems in atmospheric acoustics are supplemented by extending several traditional computational methods to this field. Finally, in the chapter on “remote sensing for the atmosphere”, the application aspects of atmo-

---

1) This is a “word-for-word” translation of a famous Chinese idiom (usually a self-deprecating remark), whose actual implication is “to issue some opinion, suggestion or writings of lower level in order to inspire the corresponding ones of higher level”. Thus, the author expects that a book of much higher level will be contributed to this field in the near future.

spheric acoustics were discussed from the angle of the “inverse problem”.

The references directly related to the text are arranged in serial numbers listed at the end of the book, while those only involving secondary problems (e.g., the derivation of a less important equation) are indicated in the corresponding footnotes.

The non-linear phenomena are inevitable in atmospheric acoustics, the fundamental problems in this aspects has been discussed comprehensively in Chapter 9. The problems concerning sound sources in atmospheric acoustics are also arousing general concern and some related advances are given in last chapter.

# Contents

## Preface

## Foreword

<b>Chapter 1</b>	<b>Introduction</b>	1
1.1	Scope of the discipline and historical review	1
1.2	Structure and acoustic properties of the atmosphere	5
1.2.1	Stratification structure of the atmosphere	5
1.2.2	Turbulence structure of the atmosphere	7
1.2.3	The acoustic properties of the atmosphere	10
1.3	Thermodynamic relationships in the atmosphere	12
1.3.1	Equation of state and adiabatic equation	12
1.3.2	Barometric equation and scale height, isothermal atmosphere and atmosphere with constant temperature gradient	14
1.3.3	Potential temperature and Vaisala-Brunt frequency	16
1.4	Fundamental relations of atmospheric dynamics	18
1.4.1	Equation of motion	18
1.4.2	Equation of continuity, equation of state, tensor presentation	19
1.4.3	Conservation laws	20
1.4.4	Geopotential altitude and coriolis force	22
1.5	Types of atmospheric waves	23
<b>Chapter 2</b>	<b>Basic Concepts and Processing Methods</b>	29
2.1	Wave equation in homogeneous atmosphere	29
2.1.1	Derivation of the wave equation	29
2.1.2	Velocity potential (acoustic potential) and wave equation including quantities of second order	31
2.1.3	Helmholtz equation	32
2.2	Energy relations in acoustic waves	33
2.2.1	Energy and energy flow density in acoustic waves	33
2.2.2	Momentum in acoustic waves and time-averaged values of acoustic pressure	34
2.2.3	Lagrange density in acoustic waves	36
2.3	Wave equation in inhomogeneous atmosphere	39

2.3.1	Wave equation and solution-defining conditions	39
2.3.2	Review of the existing solutions	41
2.4	WKB approximation	43
2.4.1	General remarks	43
2.4.2	Airy functions	45
2.4.3	The wave field in the presence of a turning point	47
2.5	Normal mode solutions	49
2.5.1	Image of virtual sources	49
2.5.2	Integral representation of the field	51
2.5.3	Normal modes	53
2.5.4	Cases of arbitrary boundaries	55
2.6	Basic concepts of geometrical (ray) acoustics	56
2.6.1	Wave fronts, rays and eikonal	56
2.6.2	Ray-tracing equations	58
2.6.3	Fermat's principle	60
<b>Chapter 3</b>	<b>Sound Propagation in Atmosphere — Refraction and Reflection</b>	<b>62</b>
3.1	Sound propagation in quiescent homogeneous media	63
3.1.1	Parametric description of wave fronts	63
3.1.2	Variation of principal radii of curvature along a ray	64
3.1.3	Caustic surface	65
3.2	Sound refraction in stratified inhomogeneous media	66
3.2.1	Refraction caused by sound-speed gradients	66
3.2.2	Refraction caused by windspeed gradients	68
3.3	Acoustic rays in the atmosphere	70
3.3.1	Ray integrals	71
3.3.2	Rays in waveguides	71
3.3.3	"Abnormal" propagation	73
3.4	Amplitude variations in quiescent media	76
3.4.1	Wave amplitude in quiescent and homogeneous media	76
3.4.2	Energy conservation along rays: extension to slowly-varying media	78
3.5	Amplitude variations in moving media	80
3.5.1	Wave equation in moving media	80
3.5.2	Conservation of wave action quantities	81
3.5.3	The Blokhintzev (Влохинцев) invariant	83
3.6	Sound wave reflection from the interface between two media	84

3.6.1	Reflection of plane waves from rigid boundaries .....	85
3.6.2	Reflection of plane waves at planes with finite specific acoustic impedances .....	86
3.6.3	Locally-reacting surfaces .....	87
3.6.4	Sound field above reflecting surfaces .....	88
3.7	Effects of ground surfaces .....	89
3.7.1	Expressions of sound fields above porous half-space media .....	90
3.7.2	Ground wave and surface wave .....	91
3.7.3	Four-parameter semi-empirical expression for calculating ground impedances .....	93
3.7.4	Excess attenuation due to the ground surfaces .....	95
3.7.5	Effects of topography .....	95
<b>Chapter 4</b>	<b>Sound Scattering and Diffraction in Atmosphere .....</b>	<b>100</b>
4.1	Basic concepts of scattering .....	101
4.1.1	Scattering of fixed rigid object .....	101
4.1.2	Scattering cross section .....	103
4.2	Scattering due to non-homogeneity .....	104
4.2.1	Differential equation for scattering .....	104
4.2.2	Integral equation for scattering .....	105
4.2.3	Asymptotic expression for scattered waves .....	106
4.2.4	Born approximation .....	107
4.3	Interactions between atmospheric turbulences and acoustic waves .....	108
4.3.1	Separating acoustic waves from turbulence .....	109
4.3.2	Wave equation in turbulent atmosphere .....	109
4.3.3	Interaction mechanisms between turbulence and acoustic waves .....	114
4.4	Sound scattering in turbulent atmosphere .....	119
4.4.1	Scattering cross section .....	119
4.4.2	Power ratio .....	121
4.4.3	Power spectra .....	122
4.5	Sound diffraction in quiescent atmosphere .....	123
4.5.1	Point source above a locally reacting surface .....	125
4.5.2	Sound field expressions in the shadow zone .....	127
4.5.3	Series expansion of diffraction formula .....	129
4.5.4	Creeping wave .....	130
4.5.5	Geometric-acoustical interpretation of creeping waves .....	132
4.6	Sound diffraction in moving atmosphere .....	134

4.6.1	Fundamental equations and formal solutions .....	134
4.6.2	Normal mode expansions .....	136
4.6.3	Asymptotic expressions for the eigen-values .....	138
4.6.4	Asymptotic expressions of the eigen-functions .....	139
4.6.5	Approximated expressions for the diffraction field .....	143
4.6.6	Analyses and conclusions .....	145
<b>Chapter 5</b>	<b>Sound Absorption in Atmosphere .....</b>	<b>150</b>
5.1	Classical absorption .....	151
5.1.1	Equation of motion for viscous fluid—Navier-Stokes equation .....	151
5.1.2	Equation of heat-conduction .....	153
5.1.3	Energy relationships of acoustic waves in viscous and heat-conducting fluids .....	154
5.1.4	Sound absorption coefficient in viscous and heat-conducting fluids .....	156
5.1.5	Practical classical sound absorption coefficient .....	158
5.1.6	Wave modes in viscous and heat-conducting media .....	159
5.2	Molecular rotational relaxation absorption .....	163
5.2.1	Absorption mechanism for modes of the internal degrees of freedom .....	163
5.2.2	Rotational relaxation contributions .....	164
5.2.3	Collision reaction rate .....	165
5.2.4	Absorption coefficient due to rotational relaxation .....	166
5.3	Molecular vibrational relaxation absorption .....	167
5.3.1	The exchange rate in mole numbers for vibration excited molecules .....	167
5.3.2	Dynamic adiabatic compression modulus .....	170
5.3.3	Vibration relaxation sound absorption coefficient .....	172
5.3.4	Vibration relaxation frequencies for oxygen and nitrogen .....	173
5.3.5	Mole fraction (molecular concentration) of water vapor .....	174
5.4	Total absorption coefficient and additional absorption .....	177
5.4.1	Total absorption coefficient .....	177
5.4.2	Additional sound absorption .....	179
5.5	Sound absorption in fog and suspended particles .....	180
5.5.1	Historical review .....	180
5.5.2	Basic analyses: mass transfer process .....	182
5.5.3	Further analyses .....	184

<b>Chapter 6 Effects from Gravity Field and Earth's Rotation .....</b>	187
6.1 Wave system in quiescent atmosphere.....	189
6.1.1 Fundamental equations and frequency dispersion equation .....	189
6.1.2 Internal waves .....	191
6.1.3 Phase velocity and group velocity .....	193
6.2 Waves in moving inhomogeneous atmosphere .....	195
6.2.1 Fundamental equations and the processing procedures.....	195
6.2.2 Transition to isothermal atmosphere, slowly-varying atmosphere .....	198
6.2.3 Velocity divergence equation .....	200
6.2.4 Energy density and lagrange density .....	201
6.3 Polarization relations .....	203
6.3.1 Phase relations between perturbed quantities.....	203
6.3.2 Air-parcel orbits .....	205
6.3.3 Complex polarization terms .....	207
6.4 Rossby waves .....	207
6.4.1 Geostrophic wind .....	207
6.4.2 Formation of Rossby wave .....	209
6.4.3 Properties of Rossby wave .....	211
6.5 External waves .....	213
6.5.1 Characteristic surface waves.....	213
6.5.2 Comparison with internal waves .....	215
6.5.3 Boundary waves .....	217
6.6 Atmospheric tides .....	220
6.6.1 Outlines .....	220
6.6.2 Theory .....	222
<b>Chapter 7 Computational Atmospheric Acoustics .....</b>	228
7.1 Fast field program (FFP) .....	230
7.1.1 Helmholtz equation, axial symmetric approximation .....	231
7.1.2 Solutions of the Helmholtz equation .....	234
7.1.3 Field at the receiver .....	237
7.1.4 Improvements to the accuracy of numerical evaluations .....	239
7.1.5 FFP solutions in homogeneous atmosphere in two dimensions .....	240
7.2 Parabolic equation (PE) method I: Crank-Nicholson parabolic equation (CNPE) method .....	242
7.2.1 Derivation of narrow-angle PE and wide-angle PE .....	243
7.2.2 Finite-difference solutions of narrow-angle PE and wide-angle PE .....	246

7.2.3 Effects of density profile .....	249
7.2.4 Finite-element solutions .....	250
7.3 Parabolic equation (PE) method II: Green function parabolic equation (GFPE) method .....	251
7.3.1 Unbounded non-refracting atmosphere .....	251
7.3.2 Refracting atmosphere .....	255
7.3.3 Three-dimensional GFPE method .....	257
7.4 Ray tracing .....	260
7.4.1 Ray equations .....	260
7.4.2 Concrete example for numerical integration— ray tracing for the infrasonic waves generated by typhoon .....	264
7.4A Ray theory for an absorbing atmosphere .....	266
7.4A.1 The generalized dispersion equation .....	267
7.4A.2 The generalized Hamilton equation .....	271
7.4A.3 The generalized ray equations and Fermat's principle .....	273
7.5 Gaussian beam (GB) approach .....	276
<b>Chapter 8 Acoustic Remote Sensing for the Atmosphere .....</b>	<b>281</b>
Part One Acoustic remote sensing for the lower atmosphere (troposphere) .....	282
8I.1 Probing system .....	282
8I.1.1 Monostatic configuration .....	283
8I.1.2 Bistatic configuration, Doppler echosonde .....	285
8I.2 The physical foundations of acoustic sounding .....	288
8I.2.1 The principle of pulse-echo sounding the atmospheric non-homogeneities .....	288
8I.2.2 Scattering volumes delimited by electro-acoustic transducers .....	290
8I.2.3 Acoustic radar equation .....	292
8I.2.4 Incoherent scattering: bistatic acoustic sounding equation .....	293
8I.2.5 Echosonde equation .....	294
8I.3 Outputs of the acoustic sounder .....	296
8I.3.1 Thermal plume detection .....	296
8I.3.2 Monitoring of Inversions .....	297
8I.3.3 Stable conditions and waves .....	298
8I.3.4 Quantitative comparisons .....	299
8I.4 Systematical algorithm for acquiring wind profiles from SODAR .....	301
8I.4.1 Doppler frequency spectrum acquired from SODAR .....	301

8I.4.2 Spatial resolution of Doppler frequency spectrum .....	303
8I.4.3 Modeling of wind velocity profile .....	303
8I.4.4 Weight-function and covariance .....	305
8I.4.5 Application examples .....	306
8I.5 Passive remote sensing .....	307
Part Two Acoustic remote sensing for the upper atmosphere .....	308
8II.1 Physical foundations of acoustic remote sensing for upper atmosphere .....	309
8II.1.1 Refraction .....	309
8II.1.2 Absorption .....	310
8II.1.3 Inferring upper atmospheric properties from acoustic measurements .....	311
8II.2 Detecting systems for remote sensing .....	312
8II.3 Recognition of waves in the atmosphere .....	314
8II.4 Passive remote sensing of infrasonic waves existing objectively in atmosphere .....	317
8II.4.1 Global infrasonic monitoring network .....	318
8II.4.2 Some prospects .....	320
<b>Chapter 9 Non-linear Atmospheric Acoustics .....</b>	<b>322</b>
9.1 Non-linear effects in sound propagation .....	322
9.1.1 Plane waves in homogeneous media .....	322
9.1.2 Synopsis of shock waves .....	325
9.1.3 Generation of harmonic waves .....	327
9.1.4 Nonlinear dissipative waves, Burger's equation .....	329
9.1.5 Nonlinear waves propagating in inhomogeneous media .....	332
9.2 Sonic boom .....	333
9.2.1 Fundamental theory of sonic boom .....	333
9.2.2 Focus of sonic boom .....	338
9.2.3 Thickness of shock wave .....	338
9.2.4 Simulating programs of sonic boom .....	339
9.3 Recent researches for sound waves in atmospheric turbulence .....	340
9.3.1 Influences from intermittence .....	341
9.3.2 Influences from anisotropy in small-sized turbulence .....	342
9.3.3 Influence from quasi-periodic coherent structure of atmosphere boundary layer (ABL) on low-frequency power spectra of backwave signals .....	344

9.3.4 Influences from coherent structure on the propagation of pulses in ABL .....	344
9.3.5 Sound scattering from anisotropy structure in mid-atmosphere .....	346
9.3.6 Influences from turbulence on non-linear waves .....	346
9.4 Atmospheric solitary waves .....	348
9.4.1 Fundamental equations for atmospheric solitary waves .....	348
9.4.2 Detection to atmospheric solitary waves .....	352
<b>Chapter 10 Sound Sources in Atmosphere .....</b>	<b>355</b>
10.1 Fundamental sound sources .....	355
10.1.1 Monopole sources .....	355
10.1.2 Dipole source .....	356
10.1.3 Quadruple sources .....	358
10.1.4 Piston sources .....	358
10.1.5 Fluid sources .....	359
10.2 Natural sound sources .....	360
10.2.1 Ocean waves .....	360
10.2.2 Heavy objects falling down into water .....	366
10.2.3 Violent firing .....	369
10.2.4 Strong wind .....	372
10.2.5 Earthquake .....	374
10.2.6 Volcano eruption and meteorite fall .....	375
10.2.7 Aurora .....	375
10.2.8 Others .....	376
10.3 Artificial sound sources .....	376
10.3.1 Airplanes .....	376
10.3.2 Rockets .....	377
10.3.3 Explosions in upper atmosphere .....	377

# Chapter 1

## Introduction

### 1.1 Scope of the discipline and historical review

The earth's atmosphere, on which humanity relies for its existence, is ubiquitously flooded with acoustic waves of various hues. These waves include both audible sound and infrasound, where the latter embodies a series stretching from "true" infrasonic waves to "acoustic gravity waves", "internal gravity waves" down to "planetary waves" and "atmospheric tides", whose behaviors becoming increasingly different to acoustic waves under ordinary concepts. As for ultrasonic waves, they occupy very less important position in atmospheric acoustics due to their rapid attenuation in the air. Atmospheric acoustics is a discipline that studies the generation, propagation (including the processes of reflection, refraction, diffraction, scattering and attenuation), reception and the various effects and applications of these waves. It is one of the most ancient and most important sub-branches in acoustics.

Obviously, the behavior of acoustic waves in the atmosphere depend strongly on the properties of the atmosphere itself. The variations of atmospheric properties in both space and time present very complicated relationships. The interaction of acoustic waves with this complex atmosphere, as well as with the variety of ground surfaces, requires a wide spectrum of physical phenomena be understood in order to completely describe a specific sound field.

Although the atmosphere consists of air, there exists qualitative differences between acoustic phenomena in the atmosphere and the "airborne-acoustic" phenomena at small scales, especially in closed spaces. This difference represents two distinct features of atmospheric acoustics. At first, it is a fundamental discipline involving the influences on acoustic waves from the variations and non-homogeneity of the earth's atmosphere, which are difficult to forecast; secondly, it is an application of acoustic waves to probe the atmosphere. The second feature can be considered as the "inverse problem" of the first one, and in a certain sense this also expresses the notion that atmospheric acoustics can also be regarded as a sub-branch of atmospheric physics. Of course, due to the difference between the main disciplines subordinated to, the focus of attention and the set-up system for these two sub-branches are quite
