Preface

The functional and organic alterations of the colon constitute one of the leading reasons why patients consult gastroenterologists. The irritable colon is one of the most common causes of discomfort in human beings. The organic pathology of the large bowel (malignancy and chronic inflammatory disease) contributes, particularly among Occidental peoples, to discouragingly high levels of morbidity and mortality.

One realizes the importance of having a thorough physiologic knowledge of the colon in order to scientifically plan the functional treatment of organic colonic diseases.

If we consider the large amount of material published on the physiology of the esophagus, stomach, small bowel, pancreas, and liver, we realize that the colon has been relatively neglected. The chapters in this book have been written by people who have done their utmost to alter this imbalance.

I want to thank all the contributors for their generous collaboration that allows me to present in one volume virtually all the information known about the structure and function of the colon, and to record my deep gratitude to Dr. Howard Spiro for his willingness to include this volume in his series. I would also like to express my sincere appreciation to Plenum Publishing Corporation for making this book possible. A special thanks goes to Dr. Isable Ledesma de Paolo for her cooperation in selecting the material to be published, to my daughter María Angélica Bustos-Fernández de Aragone for her diversified help in the preparation of the work, and also to my secretary Marcela Claudia Alvarez for her correspondence with the authors, as well as her diligent processing and retyping of some of the revised chapters.

My wife Susana was once more an important supporter of my work.

Luis Bustos-Fernández

Contents

Preface

1. *Colon Structure*

Gregory L. Eastwood

I. Development of the Colon.....	1
II. Macroanatomy.....	3
III. Microanatomy.....	5
A. The Four Layers of the Colon.....	5
B. Epithelial Renewal.....	6
C. Epithelial Cell Types.....	8
IV. Conditions Which Affect Colonic Structure.....	10
A. Food.....	10
B. Bowel Resection.....	13
C. Colonic Disease.....	13
D. Irradiation.....	13
References.....	14

2. *Absorption and Secretion of Electrolytes by the Human Colon*

Paul Kerlin and Sidney Phillips

I. Introduction.....	17
A. Aims and Overview.....	17
B. Comparison of Man and Other Species.....	18
C. Experimental Approaches to the Study of Colonic Absorption..	18
II. Concept of Colonic Epithelium as a "Tight" Mucosa.....	20
A. Estimates of Pore Size.....	20
B. Permeability of the Colon to Water and Hydrophilic Solutes...	20
C. Transepithelial Potential Difference.....	20
D. Regional Differences.....	21

III. Absorption <i>in Vitro</i>	21
A. Sodium Transport	21
B. Chloride	23
C. Bicarbonate	23
D. Potassium	24
E. Short-Chain Fatty Acids	24
IV. Secretion <i>in Vitro</i>	25
V. Absorption by the Colon <i>in Vivo</i>	26
A. Estimates of Ileal Input into the Colon	26
B. Colonic Absorptive Capacity	27
C. Specifics of Electrolyte and Water Transport	28
VI. Intraluminal Metabolism and Absorption	29
A. Dietary Fiber and Carbohydrates	29
B. Ammonia Generation and Absorption	31
VII. Factors Modifying Colonic Absorption: Secretion <i>in Vivo</i>	31
A. Hormones	31
B. Laxatives	32
C. Bile Acids and Fatty Acids	33
VIII. Divalent Cations: Calcium, Magnesium, and Zinc	34
IX. Colonic Absorption in Disease	34
A. Colonic Overload	34
B. Diarrhea after Ileal Resection	34
C. Congenital Chloride Diarrhea	34
D. Mucosal Disease	35
E. Villous Adenoma	35
F. Constipation	36
G. Enteric Hyperoxaluria	36
H. The Role of Fecal Electrolyte Measurements in Clinical Medicine	36
X. Summary and Future Directions	36
References	37

3. *The Structure of Colonic Mucus*

Adrian Allen

I. Introduction	45
II. Isolation and Purification of Mucus Glycoproteins	46
III. Carbohydrate Chain Structure in Mucus Glycoproteins	50
IV. Protein Core and Polymeric Structure in Mucus Glycoproteins	55
V. The Relationship between Glycoprotein Structure and the Gel- Forming Properties of Mucus Secretions	57
References	60

4. *The Physiology of Colonic Mucus Secretion*

*L. Bustos-Fernández, M. I. Ledesma-Paolo, J. A. Kofoed, E. Gonzalez,
S. Hamamura, K. Ogawa-Furuya, and C. Bernard*

I. Introduction	65
II. Secretory Stimulants	65
III. Organic Anion	66
A. Short-Chain Fatty Acids	66
B. Long-Chain Fatty Acids	67
C. Bile Acids	68
IV. Microorganisms	70
A. Noninvasive Toxigenic Enteropathy	70
B. Invasive Enteropathy	70
V. Immune Complexes	70
VI. Laxatives	70
A. Ricinoleic Acid	70
B. Dioctyl Sodium Sulfosuccinate	71
C. Polyphenolics: Bisacodyl	71
VII. Characteristics of Secreted Mucus	71
A. Biosynthesis of Mucus	72
VIII. Mechanisms of the Secretory Response	73
IX. Neuroendocrine and Chemical Mediators in Control of Colonic Mucus Secretion	74
A. Cholinergic Influence	74
B. Adrenergic Influence	75
C. VIP Influence	75
D. Prostaglandin Influence	75
X. Function of the Mucus	76
References	76

5. *Immunology of the Colon*

D. P. Jewell and W. S. Selby

I. Introduction	79
II. The Nature of the Immune-Cell Population	80
A. Immunoglobulin-Containing Cells	80
B. T-Lymphocytes	84
C. Killer and Natural Killer Cells	89
D. Macrophages	90
E. Other Cells	90
III. The Origin of the Immune-Cell Population	91

IV. Synthesis of Immunoglobulin and Complement.....	92
A. Immunoglobulin	92
B. Complement	92
V. Response of the Colon to Immunological Reactions.....	93
A. Type I Hypersensitivity	93
B. Type II Hypersensitivity	93
C. Type III Hypersensitivity.....	94
D. Type IV Hypersensitivity.....	94
VI. Summary and Conclusions.....	95
References	95

6. *Bacteriology of the Colon*

Gary L. Simon and Sherwood L. Gorbach

I. The Normal Microflora	103
A. Description of the Microflora	103
B. Methods of Studying the Microflora	104
C. The Influence of Host Factors on the Microflora	105
D. Stability of the Microflora	107
E. The Effects of the Microflora on Intestinal Structure and Function.....	108
II. Intraabdominal Sepsis.....	109
III. The Relationship between Colon Cancer and the Intestinal Microflora	110
References	114

7. *Storage and Propulsion Along the Large Intestine*

Ghislain Devroede

I. Storage in the Large Bowel.....	121
A. Storage in the Ascending Colon	121
B. Storage in the Descending Colon	122
C. Storage in the Rectum	123
II. Propulsion in the Colon	128
III. Defecation	131
References	133

8. *Bulk Agents in the Colon**M. A. Eastwood and J. A. Robertson*

I. Fiber and Feces.....	141
II. Fecal Bulking Agents.....	143
III. Dietary Fiber and the Plant Cell Wall Structure.....	143
IV. Chemistry of Fiber.....	144
V. The Morphology of Fiber.....	145
VI. The Physical Properties of Fiber.....	145
A. "Cation Exchange".....	147
VII. Normal Stool.....	152
VIII. Dilution of Fecal Contents.....	153
IX. Fecal Constituents.....	155
X. Microflora of the Colon.....	155
XI. The Digestion and Utilization of Fiber.....	155
XII. Stool Consistency.....	156
XIII. Intestinal Transit Time.....	156
XIV. Fiber and Colonic Motility.....	157
XV. Constipation.....	157
XVI. Irritable Bowel Syndrome.....	158
XVII. Diverticular Disease.....	158
XVIII. Inflammatory Bowel Disease.....	160
XIX. Conclusions.....	160
References.....	161

9. *The Regulatory Peptides of the Colon**Julia M. Polak, Anne E. Bishop, and S. R. Bloom*

I. Introduction.....	167
II. Technology.....	167
A. Immunocytochemistry.....	167
B. Radioimmunoassay.....	168
III. Regulatory Peptides of the Colon.....	168
IV. Peptides in the Autonomic Innervation of the Colon.....	170
A. VIP.....	170
B. Substance P.....	172
V. Peptides in Endocrine Mucosal Cells.....	176
A. Somatostatin.....	176
B. Enteroglucagon.....	176

VI. Other Regulatory Peptides	178
A. Bombesin	178
B. The Enkephalins	182
C. CCK/Gastrin	183
VII. Conclusion	184
References	185

10. *Nerves of the Colon*

Ove Lundgren and Mats Jodal

I. The Extrinsic Innervation of the Colon	187
A. The Sympathetic Nerves	188
B. The Parasympathetic Nerves	188
II. The Intrinsic Innervation of the Colon	190
A. The Nerve Plexuses	190
B. The Innervation of Colonic Muscle Layers	193
C. The Innervation of Colonic Vasculature	193
III. The Morphology of Colonic Neurones	195
IV. The Histochemistry of Colonic Neurones	196
A. Norepinephrine	197
B. Acetylcholine	198
C. 5HT, serotonin	199
D. Adenosine 5'-triphosphate	200
E. Peptidergic Neurones	200
V. Electrophysiological Characteristics of Enteric Neurons	205
VI. Concluding Remarks	206

Colon Structure

Gregory L. Eastwood

I. DEVELOPMENT OF THE COLON

During the 5th week of human gestation, the midgut begins to elongate rapidly and extrudes into the umbilical cord. The subsequent enlargement and return of the midgut loop to the abdomen, and the rotation of the bowel during this process, determines the adult configuration of the colon.

The rotation and final placement of the midgut occurs in three stages. The first stage marks the extrusion of the midgut into the umbilical cord, where it remains between the 5th and 10th weeks. This process produces a 90-degree-counterclockwise rotation of the midgut loop, when the embryo is viewed from the ventral side.

The second stage coincides with the return of the midgut to the abdomen. The small intestine enters first, to the right of the superior mesenteric artery, but as more gut returns, the first folds are pushed behind the artery into the left abdomen. These loops of small bowel, in turn, displace the dorsal mesentery of the hindgut to the left so that the descending colon occupies the left flank. The cecum and ascending colon are the last to be reduced into the abdomen and lie at first in the right upper quadrant in front of the small bowel. The colon subsequently elongates, pushing the cecum downward by the 11th week; and completing a 270-degree rotation of the midgut loop.

During the third stage, which continues until shortly before birth, the cecum descends further into the iliac fossa. The mesenteries of the cecum, ascending colon, hepatic flexure, splenic flexure, and descending colon become fused to the posterior abdominal wall, leaving only the transverse colon and sigmoid colon on free mesenteries. The final placement of the colon within the abdomen is thus achieved.

In the rat, between the 16th and 20th days of a 22-day gestation, the mucosa of the colon changes from a simple tube with a tiny lumen lined by stratified epithelium (Fig. 1) to a much more complex structure with a large lumen and well-developed crypts

lined by a single layer of columnar epithelium (Fig. 2).¹ Further, proliferating cells are present throughout the early stratified epithelium. However, when the crypts develop, the proliferating cells are confined to the lower half of the crypts.¹ An increase in glycoprotein synthesis and the development of the adult pattern of intracellular migration of newly synthesized glycoproteins parallel the changes in cellular differentiation.²

Nearly 70 years ago, Johnson described the development of the mucosa of the large intestine in human embryos.³ He found that the large intestine initially is a simple tube of epithelium, similar to the findings in the rat, and is the last portion of the digestive tract to show distinctive changes in the mucosa. The first change to occur is the formation of longitudinal ridges, which appear first in the rectum and then extend proximally. The ridges also arise in the region of the cecum and subsequently extend distally. Thus, the transverse colon is the last portion of the colon to develop these structures. Villi then form from the longitudinal ridges by segmentation of the ridges and budding of new growths. The mucosal crypts develop from knoblike protuberances of epithelium which extend into the underlying mesenchyme. As the crypts enlarge, the villi diminish in size, until the mature pattern of a flat mucosa which contains only closely spaced crypts, without villi, is achieved.

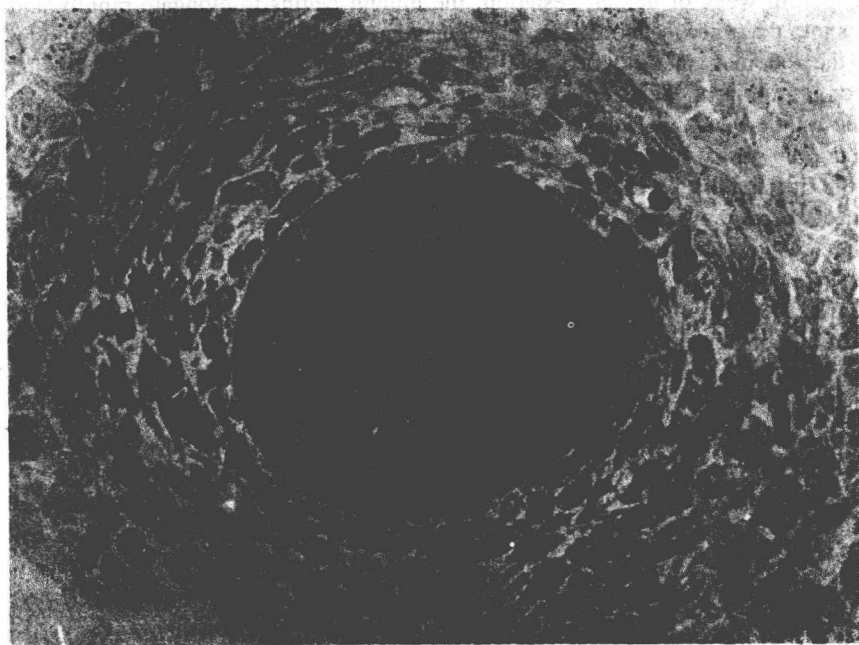

Figure 1. Light microautoradiograph of a cross-section of the colon from a 16-day-gestation fetal rat. The tubular gut consists of a tiny lumen surrounded by 2- to 3-cell-thick layer of stratified epithelium, which in turn is surrounded by a concentrically arranged mesenchyme. Labeled nuclei, identified by accumulations of black granules, are randomly scattered throughout the epithelium and the mesenchyme. (Toluidine blue, $\times 600$)
