Foreword

NEARLY TWENTY YEARS after the first ideas for L^AT_EX₂ ϵ emerged, the use of L^AT_EX to produce high-quality technical documents shows no sign of waning. Indeed, over the past 5 or so years there has been if anything an *upturn* in interest in using L^AT_EX. Better editors, faster computers and the range of powerful L^AT_EX packages have all contributed to this increased uptake.

For the new user, this vibrancy can appear intimidating. The range of packages available for use with L^AT_EX is vast, and it is not always obvious which is the ‘best of breed.’ What new users need therefore is a guide not just to the basics of the L^AT_EX approach, but also help in navigating this ecosystem so that they can produce the documents they need as rapidly as possible.

Creating well-designed documents is about more than the technical detail of any typesetting system, and so as well as learning L^AT_EX it is also necessary to understand the wider ideas of good writing and good design if one is to create truly ‘beautiful’ material.

In *L^AT_EX and Friends*, Marc van Dongen provides an integrated solution to these inter-related requirements. Treating the presentation of beautiful documents as the key aim of the reader, it offers advice on good practice (both in L^AT_EX terms and beyond) in the relevant context for the beginner. It also avoids the problem seen in many texts, which fall short in supporting the transition from beginner to advanced user. Thus while new L^AT_EX users will find the information they need here, so will more established users, making this not only a beginners’ guide but also a reference manual for day-to-day L^AT_EX users.

Joseph Wright

Preface

THIS BOOK PROVIDES students with an introduction to technical writing and computer presentations with L^AT_EX, which is the de-facto standard in computer science and mathematics. The book may also be used as a reference for seasoned L^AT_EX users.

The book offers techniques for writing large and complex documents, preparing computer presentations, and creating complex graphics in an integrated manner. The book's website, which may be found at <http://csweb.ucc.ie/~dongen/LAF>, has three separate chapters explaining how to use a widely used L^AT_EX distribution on Windows, on Unix, and on the Mac. These chapters also provide an introduction to some selected integrated development environments (IDES).

I have tried to minimise the number of classes and style files the reader has to know. This is one of the main reasons why I decided to use the `amsmath` package for the presentation of mathematics, and decided to use `tikz`, `pgfplots`, and `beamer` for the creation of diagrams, data plots, and computer presentations. Another advantage of this approach is that it simplifies the process of creating a viewable/printable output file because everything should work with `pdflatex`, which is a program that turns L^AT_EX into pdf.

The book avoids the use of what is known in the L^AT_EX community as “verbatim” commands and environments, except when it comes to including, well, verbatim program listings. The main reason for this decision is that verbatim commands in the hands of beginners often lead to errors that are difficult to find and are not always so easy to resolve. By no means should the decision to omit verbatim commands be a limitation; this book was written without verbatim commands, so why should you need them when you're writing a thesis or dissertation?

Book Outline

THIS BOOK has seven parts, some of which are more technical than others. The following is a short outline.

The first two parts are called *Basics* and *Basic Typesetting*. These parts introduce the reader to the basic L^AT_EX commands for typesetting and cross-referencing. They also explain how to create one or several bibliographies and one or several indexes or glossaries.

The next part is *Tables, Diagrams, and Data Plots*, which is about presenting data in tables, diagrams with the `tikz` package, and data plots with the `pgfplots` package.

Mathematics and Algorithms is the next part. It explains how to typeset mathematics, how to typeset algorithms in pseudo-code, and how to present program listings.

This is followed by *Automation*, which explains how to implement user-defined commands, how to implement option parsing, and how to implement conditional branching. Some readers may wish to skip this part because it is more technical than the other parts.

Miscellany is the next part. It is a collection of optional chapters, some of which are of a more technical nature than others. The first, relatively easy, chapter explains how to create computer presentations with the `beamer` package. It continues with two more technical chapters that explain how to implement user-defined classes and packages and how to use OpenType fonts.

The last part is *References and Bibliography*, which is a collection of indexes, a list of acronyms, a bibliography, and a short typographic jargon reference. Readers not familiar with notions such as characters, glyphs, ligatures, serifs, kerning, fonts, typefaces, points, point size and leading, ems, and ens, are invited to start with the jargon reference before reading the rest of the book.

Overall, the chapters are well balanced but the chapters about typesetting mathematics and presenting diagrams with `tikz` are a bit longer and more detailed. This is why it was decided to split the presentation on typesetting mathematics into two separate chapters. The first of these chapters should be sufficient for most readers. The chapter about presenting diagrams with `tikz` was not split because it was felt that most readers who are interested in some of this chapter would also be interested in the rest.

Acknowledgements

THIS BOOK would not have been possible without the help of many. First of all, I should like to thank Don Knuth for writing $\text{T}_{\text{E}}\text{X}$ and Leslie Lamport for writing $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ —without them the landscape of computer-based typesetting would have been dominated by Bill. I should like to thank Eddie Kohler for writing $\text{o}\text{T}\text{T}\text{O}\text{T}\text{F}\text{M}$ and for his help. I am grateful to Till Tantau and colleagues for writing the beautiful $\text{t}\text{i}\text{k}\text{z}$ package and the $\text{b}\text{e}\text{a}\text{m}\text{e}\text{r}$ class. Both of them are stars in terms of functionality, productivity, and documentation. Thanks to David Farley and Dario Taraborelli for letting me include the pictures in Figures 4.2 and 16.1. Many thanks to Billy Foley and the University College Cork Art Collection for letting me include the pictures at the back of the part titlepages. I should like to thank Frank Böhme, George Boyle, Tom Carroll, Hans Hagen, Taco Hoekwater, Finbarr Holland, Rik Kabel, Mico Loretan, Ben McKay, Luca Mercriadri, Oliver Nash, Oleg Paraschenko, Jason Quinlan, Lisa Swenson, and Uwe Ziegenhagen for useful comments on early drafts. I should also like to thank Paul Blaga, Robin Fairbairns, Peter Flynn, Francisco A. F. Reinaldo, and Boris Veytsman for reviewing the book. Special thanks to Joseph Wright who was so kind to proofread the entire book and to write the foreword. His critical eye spotted many known and unknown errors. Many thanks to Mr Engesser, Ms Glaunsinger, and Ms Fisher at Springer for providing the opportunity to publish this book and for helping me bring this project to a successful end. Finally, I should like to thank all those who have worked on $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ and friends, all those who have supported $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ and friends, and all who have answered all my $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ and $\text{M}\text{E}\text{T}\text{A}\text{P}\text{O}\text{S}\text{T}$ questions over the last two decades or so. The following are but a few: André Heck, Barbara Beeton, Cristian Feuer-sänger, Dan Luecking, David Carlisle, David Kastrup, Denis Roegel, Donald Arseneau, D. P. Story, Frank Mittelbach, Frank van Raalte, Hans Hagen, Heiko Oberdiek, Jim Hefferon, John Hobby, Jonathan Fine, Jonathan Kew, Karl Berry, Kees van der Laan, Keith Reckdahl, Kjell Magne Fauske, Mark Wibrow, Nelson Beebe, Peter Wilson, Philipp Lehman, Rainer Schöpf, Ross Moore, Scot Pakin, Sebastian Rahtz, Stephan Hugel, Taco Hoekwater, Thomas Esser, Ulrike Fisher, Victor Eijkhout, Vincent Zoonekynd, Will Robertson, and all the many, many others. Without them the $\text{T}_{\text{E}}\text{X}$ community would have been much worse off.
