Structure and Properties of Polymers

Preface

Since 1958, the Department of Polymer Chemistry and Physics has been built in the University of Science and Technology of China (USTC). The course of “Structure and Properties of Polymers” lectured by deceased Academician Prof. Qian Renyuan is being taught since 50 years. The textbook of “Structure and Properties of Polymers” based on the lecture notes and published by Science Press (the first edition in 1981) has been adopted as a standard textbook by several Universities in China. In recent ten years, the author has not only contributed in the development in Polymer Physics, but also carried intense teaching research, resulting in the new understanding of the existing system and its key points. The course has been welcomed unanimously by the students. Thus, the course has won “outstanding teaching research achievement award” at provincial and national level. The textbook is updated on his teaching research.

The Polymer Science consists of three parts: Polymer Chemistry, Polymer Physics and Polymer Processing. Polymer chemistry investigates how to synthesize the polymers through the polymerization of the monomers, including polymer processing, how to manufacture the polymer products from the raw polymers? Polymer Physics includes all kinds of physical contents related with the polymers.

As an undergraduate course “polymer physics” is hard to understand the task of “all kinds of physical contents”. The reasons are obvious. Firstly, the Polymer Physics has not reached the maturity as like that in other branches of physics. On the other hand the Polymer Physics belongs to the frame of chemistry and the students of Polymer Physics find it difficult to accept the deep knowledge on mathematics and physics. Polymer Physics deals with the structure and properties of polymers and their relationship, therefore “Structure and Properties of Polymer” has been introduced in this textbook. According to the molecular weight, a polymer may be divided into high polymer and low polymer, but the polymers used as materials are of high molecular weight. The low polymers are used as adhesives and high-energy propellants etc, therefore they are not included in the scope of this textbook.

The basic tasks of the course includes the structure and properties of polymers, opening the inherent relationships and basic laws between them, in order to provide the theoretical base for synthesis, processing, testing, selecting and exploitation of polymers. The author suggests that there are three levels in the relationship between structure and properties of polymers, i.e. “the relationship between chemical structure and material properties” connected through the molecular motion. The relationship between condensed state structure and product properties” connected through the product design, and “the relationship between electronic state structure and material functions” connected through the knowledge of condensed state physics. Due to the historical reason, the main contents are “the relationship between chemical structure and material properties”. It is necessary to establish the normal courses of “Rheology” and “Condensed State Physics” in order to understand the second “relationship between condensed state structure and product properties” and the third “relationship between electronic state structure and materials functions”. Although these are beyond the scope of the

present textbook, but the idea of three levels in the relationship between structure and properties of polymers has been kept in the mind by the author and has been included in the textbook.

It is worth to point out that Chinese polymer physicists have carried out an indepth and systematic research work from an international point of view on the internal action between polymer chains, especially between chain units, and all phases of polymer—polymer solution, amorphous, crystalline and liquid crystal polymers. A number of International pioneering research results have been made. Some new concepts have been proposed in the field of Polymer Physics and the school of polymer physics with Chinese characteristics. Chinese scientists have also created original electromagnetic vibration plasticating extrusion processing of polymers etc., which are presented in the textbook. Besides, new contents such as the macroscopic single crystal of polymer, possible two-dimensional rubber state etc are added in the textbook. Some new concepts such as different polymer crystals may be obtained by the “polymerization first, then crystallization” or “crystallization first, then polymerization”. WLF equation, a special temperature dependence obeyed by special molecular motion of polymers have been introduced.

The discussion and research results in many open-published textbooks and monographs are quoted during the writing. The author would like to extend his deepest gratitude to all of them. The author would also like to thank Prof. Zhu Pingping, Associate Prof. Yang Haiyang for their suggestions, Senior Engineer Li Chune for her printing and checking the manuscript. The contents of this textbook have been taught in the Department of Polymer Science and Engineering, USTC every year and in the Changchun Institute of Applied Chemistry, Chinese Academy of Sciences for 7 years. Several good suggestions have come from the students. A sincere thanks to them. Many textbooks and references on Polymer Physics have been listed in the appendix for readers for checking and further reading. In another appendix, more than 30 published papers about teaching research articles on polymer physics written by the author in recent years have been listed. They may be read by the reader as reference to share our experiences during the research.

Due to the limited capability of the author, some missing errors at inappropriate places are unavoidable, so the author welcomes readers and experts criticism, to point out and make corrections without sparing.

Hefei, Anhui, China

Preface for English Edition

The “Polymer Physics” or “Structure and Properties of Polymers” has been recognized as a difficult course since the content is vast and needs higher mathematical foundation, especially for the students in chemistry. Consequently, a good textbook will be important for teaching the course. Based on teaching practices in the University of Science and Technology of China, and the Changchun Applied Chemistry Institute. Chinese Academy of Sciences during past several decades, has highlighted the “Structure and Properties of Polymers, Updated Edition” including relationship between structure and properties, deleting obsolete contents and adding the latest scientific and technological achievements, combined with author’s experiences during the research.

“Structure and Properties of Polymers, Updated Edition” was translated from its Chinese edition with a few corrections, which was originally written for the students in China. The appendices have been given up since the most referenced textbooks listed and teaching research articles are written in Chinese. Translation of the textbook into English is not an easy job. Fortunately, I have got a lot of help from my friends and former students during the translation. They are Prof. Zhu Pingping, Drs. Yang Haiyang, Zou Gang, Bao Suping, Jing Bangkun, Fang Kun, Chen Dazhu, who translated one complete chapter and parts of the other chapters, and Drs. Sheng Xia, Chen Xin, Ye Fan, Wu Xiaosong who modified the translated manuscript(s). I would also like to extend my special thanks to Prof Jim White for his useful suggestions.

The grant from the Graduate School of University of Science & Technology of China is gratefully acknowledged.

Contents

Preface

Preface for English edition

Chapter 1 Short-range Structure of Polymers	1
1.1 Characteristics of structure of polymers and properties of polymers	1
1.1.1 Talking about soft matter	1
1.1.2 Features of polymer structure	1
1.1.3 The concept of polymer properties	5
1.2 Inter and intra-macromolecular interactions	7
1.2.1 Chemical bond	7
1.2.2 Polar interactions	10
1.2.3 Van der Waals force and hydrogen bond	11
1.2.4 Cohesion energy and cohesion energy density	13
1.3 Short range structure of polymer chains	14
1.3.1 Chemical component of structure units	15
1.3.2 End groups	16
1.3.3 Bonding mode of structural units	17
1.3.4 Steric configuration of structural units	19
1.3.5 Branching and crosslinking	21
1.3.6 Bonding sequence of structural units	24
1.4 Measurement of the short-range structures of polymer chains	28
1.4.1 General chemical methods	28
1.4.2 Pyrolysis gas chromatography	29
1.4.3 Infrared spectroscopy	29
1.4.4 X-ray diffraction	30
1.4.5 Nuclear magnetic resonance	30
1.4.6 Mass spectrometry	30
Review questions	32
Chapter 2 Long-range structure of polymer chain	34
2.1 Internal rotation and flexibility of polymer chains	35
2.1.1 Internal rotation in small molecules	35
2.1.2 Flexibility of polymer chains	38
2.2 Conformation Statistics of Polymer Chains	41
2.2.1 The mean square end-to-end distance	41
2.2.2 The mean square end-to-end distance of a real chain	50

2.2.3 The factors affecting flexibility of polymer chains.....	53
2.3 Rigid chain structure	57
Review questions	59
Chapter 3 Structure of condensed state of polymer chains	60
3.1 Introduction.....	60
3.1.1 Gas, liquid, solid, gaseous phase, liquid phase and solid phase	60
3.1.2 Basic issues about condensed structure of polymer chains.....	61
3.1.3 How do the polymer chains get together?	62
3.1.4 The contents of condensed state of polymer chains.....	64
3.1.5 The conformation of polymer chain in crystal	66
3.1.6 Relationship between structures and properties of condensed state.....	69
3.2 Structure models of condensed state of polymer chains	69
3.2.1 Structure models of crystalline polymer	69
3.2.2 Structural model of amorphous polymers	75
3.2.3 Entanglement of polymer chains	77
3.3 Crystalline morphology of polymers	79
3.3.1 First polymerization and then crystallization	79
3.3.2 Crystallization from solution or melt	80
3.3.3 Solid-state crystalline polymerization and macroscopic crystal of polymer	84
3.3.4 Single-chain single crystal	91
3.3.5 Crystallization of ultra-thin film of polymers	97
3.4 Crystallization Processes of Polymers	99
3.4.1 Process of crystallization	99
3.4.2 Crystallization kinetics and Avrami's Equation	101
3.4.3 Structural and environmental factors that affect the polymer crystallization	105
3.4.4 Strobl model of polymer crystal growth	110
3.5 Characterization of Polymer Crystallization	111
3.5.1 Characterization of crystalline morphology of polymers	111
3.5.2 Measurement of basic parameter of polymer crystal	112
3.5.3 Methods for studying the crystallization processes of polymers	114
3.5.4 Degree of crystallinity of polymers	115
3.6 Polymer Liquid crystals	117
3.6.1 Liquid crystals and their types	117
3.6.2 Polymer liquid crystals	120
3.6.3 Characterization of polymer liquid crystals	122
3.6.4 Molecular structure of polymer liquid crystals	122
3.6.5 Phase behavior of polymer liquid crystal	125
3.6.6 Functional polymer liquid crystals	130
3.6.7 Application of polymer liquid crystals	133
3.6.8 The contribution of Chinese macromolecular scientists to the research of polymer liquid crystals	134
3.7 The orientation state of polymers	137

3.7.1 Basic concepts	138
3.7.2 Stretching orientation of the crystalline polymer	142
3.7.3 Orientation degree and their determining methods.....	144
3.7.4 The factors affecting the orientation of polymers	147
3.7.5 Contribution of Chinese scientist in orientation state—GOLR state.....	149
Review questions	150
Chapter 4 The molecular motion in polymers	153
4.1 Characteristics of molecular motion in polymers	153
4.1.1 Multiplicity of motion units	153
4.1.2 Time dependence of molecular motion	155
4.1.3 Temperature dependence of molecular motion in polymers	156
4.2 Characteristic segment motion in polymers—glass transition	158
4.2.1 Definition of glass transition	158
4.2.2 Practical significance of glass transition	158
4.2.3 Academic significance of glass transition	158
4.2.4 Phenomenas of glass transition	158
4.2.5 Theories of glass transition	161
4.2.6 The structural factors affecting on glass temperature.....	167
4.2.7 Methods to tailor glass temperature	172
4.2.8 Some special cases of the glass transition of polymer.....	180
4.3 Motion units smaller than the segments——The secondary transition of glass polymers	184
4.3.1 Local relaxation	184
4.3.2 Crank-shaft motion	184
4.3.3 The motion of hetero-units in heterochain polymer.....	185
4.3.4 The movement of the side groups or side chains	186
4.3.5 Physical aging.....	187
4.4 Molecular motion of crystalline polymers	188
4.4.1 Melting of crystalline polymers	188
4.4.2 Transition of crystalline morphology	189
4.4.3 Movement of small side groups in the crystalline region	190
4.4.4 Movement of the defects in crystalline region	191
4.4.5 Interaction between crystalline and amorphous region	191
4.4.6 Friction loss of granules in crystalline region	191
4.5 Methods for studying molecular motion of polymers	191
4.5.1 dilatometer method	192
4.5.2 Differential scanning calorimetry	195
4.5.3 Mechanical relaxation methods	196
4.5.4 Dielectric relaxation	210
4.5.5 Wide-line Nuclear Magnetic Resonance	211
Review questions	217

Chapter 5 Mechanical Properties of polymers	219
5.1 Type of deformation, stress, strain and Hooke's Law	219
5.1.1 Simple Shear	219
5.1.2 Bulk compression	220
5.1.3 Simple tensile and simple compression	221
5.1.4 Flexure	222
5.1.5 Hooke's law	222
5.2 Rubber elasticity	223
5.2.1 The features of rubber elasticity	223
5.2.2 Thermodynamic analysis of rubber elasticity	224
5.2.3 Statistical theory of rubber elasticity	227
5.2.4 Contribution of internal energy to the energy function	233
5.2.5 Experimental study of stress-strain relationship of rubber and its network	234
5.2.6 The phenomenological theory of rubber in larger deformation	239
5.3 Viscoelasticity of polymers	242
5.3.1 Mechanical models of polymer viscoelasticity	243
5.3.2 Maxwell model	244
5.3.3 Voigt-Kelvin model	249
5.3.4 The three-component mechanical model —Standard linear solid	253
5.3.5 Generalized mechanical model	257
5.3.6 Relaxation and retardation time spectrum	260
5.4 Temperature dependence of mechanical behavior of polymers	263
5.4.1 Deformation-temperature curve, modulus-temperature curve and temperature spectra of dynamic mechanical testing	264
5.4.2 Time-temperature Equivalence and time-temperature superposition principle	268
5.4.3 The master curve	270
5.4.4 WLF equation	272
5.5 Plasticity and yield behavior of polymers	275
5.5.1 Stress-strain curve, true stress and true strain	275
5.5.2 Features of yield behavior of polymer	279
5.5.3 The molecular interpretation of the yield	282
5.5.4 The post-yield phenomena	285
5.6 Breaking and fracture of polymers	290
5.6.1 Brittle and ductile fracture of polymers	291
5.6.2 The theoretical strength of polymers	296
5.6.3 Stress concentration	298
5.6.4 Griffith theory	301
5.6.5 Zhurkov theory	302
5.6.6 A generalized theory of fracture mechanics	305
5.6.7 Craze of glassy polymers	307
5.6.8 Impact strength of polymers	309
Review questions	316

Chapter 6 Rheological properties of polymer	320
6.1 Molding methods and properties of polymer melts	320
6.2 Non-Newtonian behavior of polymer melts	321
6.2.1 Non-Newtonian behavior of polymer melts	322
6.2.2 Non-Newtonian fluids	322
6.2.3 The flow of polymer melts	324
6.3 Measurements of shear viscosity and influencing factors	327
6.3.1 Test methods of shear viscosity	327
6.3.2 Factors affecting the shear viscosity of polymer melts	330
6.4 Tensile viscosity of polymer melts	341
6.4.1 Tensile viscosity	341
6.4.2 Types of tensile viscosity of polymer melts	342
6.4.3 Technical significance of tensile viscosity	343
6.4.4 The experimental measurement of tensile viscosity	344
6.5 Elasticity of polymer melts	345
6.5.1 The shear modulus of elasticity	346
6.5.2 Tensile elasticity	348
6.5.3 Normal stress	349
6.5.4 Rod climbing	351
6.5.5 The tubeless siphon effect	351
6.5.6 End pressure drop	351
6.5.7 Extrusion die swell	352
6.5.8 Unsteady flow and melt fracture	354
6.6 Typical flow analysis in processing	357
6.6.1 Extrusion	357
6.6.2 Extrusion blow moulding	361
6.7 The electromagnetic dynamic plasticating extrusion of polymers	362
6.8 The relationship between article and mechanical properties of polymers	365
Review questions	372
Chapter 7 Electrical Properties of Polymers	374
7.1 Characteristics of electrical properties of polymers	374
7.2 Dielectric properties of polymers	375
7.2.1 The general concept of dielectric properties	375
7.2.2 Dielectric constant and dielectric loss	378
7.2.3 The analogy of electrical model and the mechanical model	380
7.3 Dielectric relaxations of polymer	382
7.3.1 Dipole moment of the polymer chain	382
7.3.2 Dielectric constant and dielectric loss of polymer	385
7.3.3 Influence factors of polymer dielectric properties	386
7.3.4 Dielectric relaxation and dielectric relaxation spectroscopy of polymers	389
7.4 Conductivity of Polymers	392

7.4.1	Basic concepts of conducting polymers.....	393
7.4.2	Peierls Instability	394
7.4.3	Polyacetylene	396
7.4.4	Unique "soliton" state of the one-dimensional conductor	397
7.4.5	Degeneracy of the ground state in polyacetylene	398
7.4.6	The soliton and polaron in trans-polyacetylene	399
7.4.7	The electronic state in the domain wall	402
7.4.8	Doping	405
7.4.9	Polymer conductor with non-degenerate ground state	407
7.4.10	Two-dimensional system of conducting polymers	410
7.4.11	Other Conducting Polymers	411
7.5	Conjugated polymer electroluminescence	414
7.6	Superconductivity of polymer	419
7.6.1	Conductive path of free electrons in Superconductor	419
7.6.2	The basic concept of superconducting state and BCS superconducting theory	420
7.6.3	Little's Model of Superconducting Polymer	424
7.7	The Conductivity of single-chain polymer	425
7.8	Other Electrical Properties of Polymer	429
7.8.1	Polymer Piezoelectric Polarization and Thermal-electric Polarization	429
7.8.2	Polymer Electrets and Pyroelectricity	434
7.8.3	Electrical Breakdown of Polymer	438
7.8.4	Electrostatic phenomena in polymer	441
	Review questions	445
Chapter 8	Thermal, optical and magnetic properties of polymers	447
8.1	Thermal stability of polymers and high temperature resistant polymer materials	447
8.1.1	Relationship of polymer structure and thermal resistance—Mark triangle	448
8.1.2	Thermal decomposition of polymers	455
8.2	Thermal expansion of polymers	463
8.2.1	Qualitative illustration of thermal expansion	463
8.2.2	Negative thermal expansion coefficient of p-toluene sulfonate (PTS)	466
8.2.3	Effect of orientation on thermal expansion of amorphous polymers	469
8.2.4	Thermal expansion of crystalline polymer	471
8.3	Thermal conductivity of polymers	474
8.3.1	Thermal conductivity of solid polymers	474
8.3.2	Thermal conductivity of polymer melt and polymer solution	477
8.4	Flame retardant polymers	481
8.5	General optical properties of polymers	484
8.5.1	Refraction	485
8.5.2	Transmittance	488
8.5.3	Reflection	489
8.6	Optical plastic	490
8.6.1	Common optical plastics	490

8.6.2 Novel optical plastics	493
8.7 Polymer optical fiber (plastic optical fiber) (POF).....	494
8.8 Polymer microlens array.....	498
8.9 Magnetic properties of polymers	499
8.9.1 General concepts of magnetic properties of organic compounds	500
8.9.2 Structural organic polymer magnets	501
Review questions	506
Chapter 9 The solution properties of polymers.....	508
9.1 The characteristics of polymer solutions	508
9.2 Polymer dissolving and solvent selection	510
9.2.1 Factors that affect the dissolving polymers	510
9.2.2 Thermodynamic of the polymer dissolving	511
9.2.3 Determine the intersolubility and solvent selection	513
9.2.4 Purpose of dissolving and usage of solution	518
9.3 Thermodynamic properties of solution of polymer with flexible chain.....	518
9.3.1 Ideal solution	518
9.3.2 Statistical theory of polymer solution—Flory-Huggins quasi-lattice model theory	519
9.3.3 Dilute solution theory	529
9.4 Phase equilibrium of polymer solution	533
9.4.1 Osmotic pressure	533
9.4.2 Q-solution	536
9.4.3 Phase separation	539
9.4.4 The swelling of the crosslinked rubber	540
9.5 Thermodynamics of compatibility of Blends	545
9.5.1 Blend	545
9.5.2 Thermodynamics of blends miscibility	546
9.5.3 Compatibilizer	551
9.6 Concentrated solution of polymer	552
9.6.1 Plasticized polymer	552
9.6.2 Spinning Solution	554
9.6.3 Jelly and Gel	554
9.7 Polyelectrolyte Solution	555
9.7.1 Polyelectrolyte Solution	555
9.7.2 Characteristics of polymer electrolyte solution	556
9.7.3 Volume phase transition of strong polyelectrolyte gels in organic solvent	557
9.8 Scale concept of polymer solution	558
Review questions	563
Chapter 10 Relative molecular weight and molecular weight distribution of polymers	565
10.1 The statistical significance of relative molecular weight	565
10.1.1 Different types of average relative molecular weights	565
10.1.2 The relationships between various average relative molecular weights	567

10.2	The breadth parameter of the relative molecular weight distribution	569
10.3	The methods for relative molecular weight measurement.....	571
10.3.1	General discussion on the methods for relative molecular weight measurement	571
10.3.2	Membrane osmotic pressure method.....	573
10.3.3	Light scattering method	575
10.3.4	Viscometry	579
10.3.5	Flory intrinsic viscosity theory	584
10.3.6	The viscosity measurement of extremely diluted solution	587
10.3.7	Automatic viscometer	588
10.3.8	Mass Spectrometry (MS)	589
10.4	The relative molecular weight distribution of polymers	593
10.4.1	The expression of relative molecular weight distribution.....	594
10.4.2	The measurement of relative molecular weight distribution	596
10.4.3	Data processing of fractionation	598
10.4.4	Size exclusion chromatography	600
	Review questions	612
