One of the major problems with which the analytical chemist is confronted is how to make the best possible use of the large amount of information on analytical principles, methods and procedures that is available in the analytical literature. As stated by Laitinen and Harris (1975), an analytical chemist can be judged in part by his skill in the critical selection of methods. Almost daily the analytical chemist is confronted with problems of optimizing analytical procedures or related problems such as the selection of the best procedure for solving a given problem. This situation is represented by the most recent definitions of analytical chemistry, stating that analytical chemists have to produce qualified, relevant information on materials and processes in an optimal way (Gottschalk, 1972; Kaiser, 1974). It is therefore surprising to note that analytical chemists in general do not seem to have taken pains to develop strategies for optimization. Until recently it was common for the choice of the best procedure for a given analytical problem to be made largely intuitively and based upon experience.

Recently, a number of papers have appeared that express the concern of an increasing number of analytical chemists with this situation. It has been our intention to discuss in this book the formal methods that are available at present for the optimization and selection of analytical methods.

Before it is possible to make a selection or to carry out an optimization, one must have criteria according to which this may be done. Consequently, the performance of analytical procedures has to be evaluated by determining one or more performance characteristics of the procedure that is to be optimized or of the procedures from which the best one is to be selected. The set of criteria has to be defined for each problem and will include quantities such as precision, accuracy, limits of detection and interferences. Up to now, most of these criteria have been used in quantitative analysis, and it is probable that another set of characteristics will be required for qualitative analysis. Measures of information may become important in this respect and, therefore, a large section is devoted to information theory. Performance characteristics are discussed

in Part I.

The next two parts of the book are devoted to the optimization of procedures. One can discern different levels of optimization (Beveridge and Schechter, 1970), and for the purpose of this book we consider three such levels:

- (1) Selection of one existing procedure from several alternatives. This is the simplest possible stage. There are several alternatives; each of these is evaluated and the one which corresponds best to the exigencies of the application is selected. The main problem here is the evaluation of the procedures. This is described in Part I.
- (2) Optimization of a procedure for which the outline is given. For example, given that the determination will be carried out colorimetrically with dithizone, select the optimal wavelength, the best concentration of dithizone, the pH, etc. This kind of problem usually consists in the selection of the optimal value of one or more continuously adjustable parameters. Occasionally, one may also have to include discrete parameters such as the kind of detector to be used. These problems are discussed in Part II.
- (3) Optimization of combinations of analytical procedures or attributes of methods. There are many instances in which analytical procedures are combined, for instance

the combination of tests in a clinical laboratory to yield the optimal diagnostic or discriminatory power;

the combination of GLC stationary phases to form a preferred set;
the combination of elementary steps in a separation procedure to yield an optimal multicomponent separation scheme.

Such combinatorial problems are discussed in Part III. The analytical laboratory as a whole may be considered as a combination of methods, apparatus, etc. Some optimization problems concerning the functioning of an analytical laboratory are therefore also included in Part III.

Laitinen (1973), in an Editorial in Analytical Chemistry, stated that an analytical method is a means to an end, and not an end in itself. Analytical chemists tend to overlook this and sometimes develop methods that are more precise, faster, etc., while forgetting the intended applications. In such

instances, one can hardly speak of optimization. The analytical procedure must be chosen in relation to the goal and questions such as "how useful is it to increase the precision of a procedure used for a particular purpose" then arise. Some problems of this kind are discussed in Part IV.

Problems of optimization in analytical chemistry are often related to other optimization problems. However, such analogies will only be recognized if problems are formulated in a more or less formal and generalized way. The analytical procedure and the analytical laboratory should be considered from the point of view of systems theory. Some aspects of such a generalizing approach are discussed in Part V. In fact, one observes that analytical chemists concerned with optimization problems intuitively follow a systems approach. It would therefore have been more logical to start this book with a discussion of systems theory, but as yet it is not possible to construct a complete systems theoretical picture of the analytical procedure and the analytical laboratory, and to some extent the topic is of academical interest. Therefore, we have started the discussion with those points which clearly are of direct value in analytical practice.

The trend towards a more formal approach of the selection of analytical methods is not really new, but it has definitely grown stronger in the last few years. It is one of the principal concerns of the very recent field of chemometrics (Kowalski, 1975). It is not only felt among those who make this their research field in general analytical chemistry, but also by analytical chemists who are concerned more directly with analytical practice, such as clinical chemists and by those who need the results of analytical determinations, such as physicians using laboratory tests for medical diagnosis. At about the same time that concepts such as information were introduced into general analytical chemistry, clinical chemists began to use multivariate data analysis techniques to investigate which analytical methods yield the most diagnostic information. If one looks at the literature cited by the "generalists" and the clinical chemists, one finds that they cite different literature and that,

in general, there seems to be very little communication between the two groups.

In some applications, formal methods for the investigation of the performance of analytical methods were introduced many years ago. This is the case, for example, with official analytical chemists, who have developed methods for the evaluation of errors likely to occur in analytical procedures. Many analytical chemists from other specialities, but who are also concerned with the evaluation of analytical methods, seem, however, to ignore the existence of such methods.

We have tried to combine the knowledge stored in these (and other) different specialities in the hope of stimulating a more systematic application of formal selection methods in analytical chemistry. Our first idea was to limit this book to newer methods or concepts, such as information theory and operational research, but it was soon clear that it would be meaningless to try and make a synthesis and not include classical statistical concepts. Therefore, a number of chapters on classical statistical methods were added. Because, on the other hand, we did not want to duplicate the material already available in several books on statistics in chemical analysis, we have tried to eliminate statistical methods designed for the evaluation of results rather than of procedures, and we have not tried to discuss the subject exhaustively. This is also true for all other chapters. More specialized knowledge should be sought in the original literature or specialized books and chapters to which we refer. Since this book was written to introduce a number of formal optimization techniques to analytical chemists and not for specialists, we have not tried to cover the existing literature exhaustively. Instead, we usually have given some references to books, review articles and a few illustrative articles.

In writing this book, we have started from the belief that some of the newer mathematical methods or theories, such as pattern recognition, information theory, operational research, etc., are relevant to some of the basic aims of analytical chemistry, such as the evaluation, optimization, selection, classification, combination and assignment of procedures or sub-procedures - in short all those processes that intervene in determining exactly which analytical procedure or

programme should be used. Unfortunately, most chemists are daunted by the task of learning how these mathematical methods function and this is not helped by the difficulty of establishing a link between the formal mathematics found in most books on this subject and analytical problems.

We have tried to treat the mathematical topics as lucidly as possible and to illustrate the text with examples, in some instances abandoning a rigorous mathematical treatment. However, we have tried to compensate for this by including a series of mathematical sections. The level of the mathematics is higher in Chapters such as 2, 3 and 4, where the subject treated is not completely unfamiliar to most analytical chemists. In those chapters where the subject matter is probably new to most analytical chemists, only the most elementary explanations are given, often in words, because we think it more important to emphasize the underlying philosophy than to explain the mathematics. In doing so, we hope we have removed the barriers of applying formal methods to optimization problems in analytical chemistry. One major difficulty encountered when writing this book was the mathematical symbolism. We have tried to present a coherent set of symbols throughout the book but, because of the diversity of the methods described, we have not been entirely successful in this respect. Nevertheless, we think that the symbols used should be sufficiently clear.

Universiteit Brussel; Chapters 2 and 3), H.C. Smit (University of Amsterdam; Chapter 10), D. Coomans (Vrije Universiteit Brussel; Chapter 20), G. Kateman (Catholic University of Nijmegen; Chapters 26 and 27) and P.M.E.M. van der Grinten (DSM, Heerlen; Chapters 26 and 27). Their suggestions were very valuable. The authors are also indebted to S. Peeters, who typed the final text,

A. Langlet-De Schrijver and L. Maes, who prepared the figures, and

C. Uytterhaegen-Hendrickx, G. De Boeck, A. Van Gend, F. Gheys and M. Segers-Geeroms who typed the manuscript. The research leading to the idea of writing this book was helped financially by organizations such as the Fonds voor Geneeskundig

Wetenschappelijk Onderzoek and the Fonds voor Kollektief en Fundamenteel Onderzoek and was stimulated by collaboration with members from the Studiegroep voor

Types of clustering procedures 18.4.2. The average linkage algorithm 18.4.3. Operational research techniques 18.4.4. The selection of the preferred set from the classification 18.5. Information and classification 18.5.1. A comparison of the information theoretical and numerical taxonomic approaches 18.5.2. Classification using an information theoretical criterion | 347 347 348 354 356 361 362 364 366 366 367 372 372 372 372 |

| 18.7. Correlation and distance | 378 |
|---|-----|
| | |
| 18.7.1. Measures of distance between elements | 379 |
| 18.7.2. Correlation and distance based on correlation | 380 |
| 18.7.3. Distance between groups | 382 |
| 10.7.3. Distance between groups | |
| Chapter 19. Factor and principal components analysis | 385 |
| 19.1. Introduction | 385 |
| 19.2. A short presentation of FPCA | 387 |
| | |
| 19.3. Basis of FPCA | 388 |
| 19.3.1. Relation to multiple regression (MR) | 388 |
| 10.2.2 FDCA as a general model for a group of similar chiests | 389 |
| 19.3.2. FPCA as a general model for a group of similar objects | |
| 19.3.3. Geometrical interpretation | 390 |
| 19.3.4. Limitations of the method | 391 |
| | |
| 19.4. Estimation of the parameters in the FPCA model | 392 |
| 19.4.1. Scaling of data | 392 |
| | 393 |
| 19.4.2. The number of factors, r | |
| 19.4.3. Estimation of loadings and factors (components) | 396 |
| 19.5. Information from the data analysis | 399 |
| | |
| 19.6. Rotations and transformations of the parameter vectors | 401 |
| 19.6.1. Transformations to simplify the parameter vectors | 402 |
| 19.6.2. Transformations to find correlations with external variables | 402 |
| | |
| 19.7. Additional data in analytical applications of FPCA | 403 |
| 19.8. Other analytical chemical applications of FPCA | 404 |
| 19.9. Conclusions | 406 |
| | |
| Chapter 20. Supervised learning methods | 409 |
| 20.1. Introduction | 409 |
| | |
| 20.2. Statistical linear discriminant analysis | 412 |
| 20.2.1. Classification | 412 |
| 20.2.2. Applications | 415 |
| | |
| 20.3. Non parametric methods | 418 |
| 20.3.1. The learning machine and related methods | 418 |
| 20.3.2. The nearest neighbor method | 422 |
| 20.3.2. The hearest heryhbor method | |
| 20.3.3. SIMCA | 423 |
| 20.4. Feature selection | 428 |
| | 428 |
| 20.4.1. General aspects | |
| 20.4.2. Methods conditioned on separation | 430 |
| 20.4.3. Some applications | 431 |
| | |
| Chapter 21. Operational research: linear programming, queueing theory | 435 |
| and some related methods | |
| 21.1. Linear programming | 435 |
| | |
| 21.2. Game theory | 438 |
| 21.2.1. Some examples | 438 |
| 21.2.2. Mathematical | 441 |
| | |
| 21.3. Queueing | 446 |
| 21.3.1. Models and assumptions | 446 |
| | 448 |
| 21.3.2. The M/M/1 and M/M/n systems | |
| 21.3.3. Applications in analytical chemistry | 451 |
| 21.4. Simulation techniques | 456 |
| | 456 |
| 21.4.1. Introduction | |
| 21.4.2. Applications in analytical chemistry | 459 |
| Chapter 22. Partial enumeration methods | 463 |
| 20.1 The optimal configuration of annuation in a (alicial) laboratory | |
| 22.1. The optimal configuration of apparatus in a (clinical) laboratory | 463 |
| 22.2. Selection of representative patterns | 466 |
| 22.2.1. The problem | 466 |
| | |
| 22.2.2. The mathematical model | 468 |
| 22.2.3. An application : the selection of GLC probes | 473 |
| Chapter 23. Graph theory and related techniques | 475 |
| | |
| 23.1. Graph theory: a shortest path application | 475 |
| 23.2. Graph theoretical classification methods | 480 |
| 23.3. Dynamic programming | 481 |
| | |
| 23.4. Sequencing and coordination methods | 486 |

| | IX |
|---|---|
| 23.4.1. The PERT technique 23.4.2. A heuristic sequencing method Chapter 24. Multicriteria analysis 24.1. Introduction 24.2. Utility functions 24.3. Outranking relations 24.4. Interactive methods | 486 490 493 493 493 495 499 |
| Part IV Requirements for analytical procedures | |
| Chapter 25. The diagnostic value of a test 25.1. Introduction 25.2. The rule of Bayes 25.3. Optimal dichotomous decisions 25.4. The ROC curve 25.4.1. Use in the selection of a cut-off point 25.4.2. Use in rating a test 25.5. Cost-benefit considerations Chapter 26. Requirements for process monitoring 26.1. Introduction 26.2. Description of the fluctuations 26.3. Monitoring with continuous analysers 26.3.1. The distortion of a Gaussian peak 26.3.2. Measuring stochastic fluctuations 26.4. Shannon's sampling method - discrete sampling 26.5. Influence of errors 26.6. Determining average compositions Chapter 27. Requirements for process control 27.1. Introduction 27.2. Measurability 27.2.1. Dead time 27.2.2. Sampling time 27.2.3. Precision 27.2.4. The total measurability 27.3. Some applications | 503 503 509 512 514 514 517 525 525 527 531 531 533 535 537 538 543 543 544 544 544 546 546 |
| Part V Systems approach in analytical chemistry | |
| Chapter 28. Analytical chemistry and systems theory 28.1. The scope of analytical chemistry 28.2. Systems theory Chapter 29. The analytical procedure 29.1. The black box 29.2. Some input and output variables and their relations 29.3. The combination of black boxes 29.4. An example 29.5. Some other ways of describing analytical procedures 29.6. Quality control 29.7. The analytical procedure as a subsystem Chapter 30. The analytical laboratory 30.1. Introduction 30.2. Some notes on the organization of the laboratory 30.3. Methods for simulating the analytical laboratory | 555 555 559 563 563 566 570 574 575 576 579 579 580 582 |
| Appendix | 587 |
| Subject index | 593 |

PART I EVALUATION OF THE PERFORMANCE OF ANALYTICAL PROCEDURES
