*I dedicate this
book to my students,
past and present.*

Preface

Some of my best friends are psychologists. They have different backgrounds and interests, but to a person they're excited about their work, the field, and the contributions being made by this intelligent and useful discipline.

I had three goals in writing this textbook. *My first goal is to spark in students the same hunger, passion, and excitement that psychologists have for their work.* Toward this end, I have tried to write a book that is not only “readable” but also warm, personal, engaging, and newsy. I have not ducked the hot and sticky issues. The ethics of animal research, the biological roots of homosexuality, and the recovery of repressed childhood memories are just a few of the current controversies that I have confronted head-on by reviewing available research. I have also made it a point to illustrate the principles of psychology with vivid events from the worlds of sports, entertainment, literature, medicine, politics, law, and current events. As a result, I never, ever, resort to “John and Mary in the dorm” hypotheticals to illustrate a point. The examples I use thus reflect my conviction that students have a deep and vested interest in a world that extends past the borders of the college campus.

My second goal is to teach students that psychology is not a mere laundry list of names, dates, theories, and terms, but is an active and dynamic process of discovery—and that the state of our knowledge evolves over time. Every psychology textbook presents the discipline as a science. Indeed, many authors devote a whole second chapter to research methods. I have taken a somewhat more integrated approach. Since research methods are central to psychology's identity and development, this topic is introduced fully and comprehensively in Chapter 1, along with the field itself. In learning about research methods, from the use of case studies to experiments and meta-analysis, students are encouraged to see science as a process that is slow, cumulative, and dynamic.

My third goal—which is the hardest to achieve but is also the most important—is to get students thinking like psychologists. I believe that an author cannot invoke critical thinking in students the way a parent spoonfeeds a baby. Rather, critical thinking is a frame of mind, an attitude that emerges naturally in response to information that is engaging and personally relevant—which leads me to the special features of this book. Determined to get the student reader to think like a psychologist, and to do so without gimmicks, I have integrated the following features into this textbook.

Special Features

“What’s Your Prediction?” Studies

To orient students to the material in each chapter—and to get them thinking in operational terms—I open each chapter with a detailed account of an actual study. Some are classics in the field; others are new. Some are laboratory experiments; others are field studies, archival studies, or self-report surveys. In some, students are asked to imagine being a subject in an experiment. In others, they are cast into the role of the researcher or an observer. In all cases, I set the stage with a vivid account of the procedures used. After students have read about the situation and have imagined being part of it, they are asked to predict the results. The actual findings are then revealed, followed by a discussion of what it all means.

I have used this technique in the classroom for many years and have found that it works like a charm. After students become personally committed to a prediction, they sit at the edge of their seats, eager to know what happened. Then when the results are revealed, they think long and hard about the study and its methods—particularly when the results contradict their predictions. Now *that's* critical thinking.

What's Your Prediction?

Nature or Nurture?

The situation You know from past research that about 15 to 20 percent of all healthy babies are inhibited, timid, and wary of strangers. You also know that 25 to 30 percent are outgoing, fearless, and eager to approach new people. These differences are apparent early in life and remain stable through childhood. But where does this trait come from? Are some infants just born that way, as parents often assume, or does temperament arise from early experiences?

To tease apart these dual effects, you decide to conduct a twin study. From monthly birth records, you contact all parents of recently born twins. Many agree to take part in your study, and you go on to recruit 178 pairs. About half are genetically identical, or monozygotic (MZ), twins; the other half are genetically nonidentical, fraternal, or dizygotic (DZ), twins. All sets of twins live together. You make appointments so that a mother and her children come to the laboratory when the twins are fourteen months old. Then they return for follow-up visits at twenty and twenty-four months old.

Along with two assistants, you meet the mother and her twins in a reception room. You explain the procedure and place a bib with an identifying letter on each child. One child is randomly selected to join the mother and a second assistant in a playroom, while the other stays in the reception area. Once the testing is complete, the children switch places.

The floor of the playroom is covered with toys. The mother sits on a sofa on the side and is asked not to pay attention to the child unless needed. At this point, the child is free to play. With the entire session being videotaped, two events are then staged to provide additional opportunities to observe the child's behavior. First, a new assistant, a stranger, enters the room holding a toy truck. Soon, she invites the child to play with her (if the child has not already done so). Next, the assistant who brought the mother and child into the playroom opens a cabinet and pulls out an unfamiliar object—a blue stuffed toy monster or a robot made of tin cans and colored lights. After two minutes, the child is encouraged to approach the object (if he or she has not already done so).

To determine each child's level of inhibition, you review the session tapes and record how long it took

Feature Boxes

In every chapter of the text, you will find two or three special, high-interest boxes designed to get students thinking like psychologists. Toward this end, I have written four types of boxes: "Psychology and . . .," "How to . . .," "Through the Global Window," and "Debunking the Myth."

PSYCHOLOGY AND . . . LAW

Eyewitness Identification Biases

"I'll never forget that face!" When these words are uttered, police officers, judges, and juries take notice. The problem is, witnesses make mistakes. Recently, the U.S. Department of Justice reviewed twenty-eight cases involving convicted felons who were later proved innocent by DNA tests not available at the time of their trials. Shockingly, every single one of these cases contained a mistaken eyewitness identification (Connors et al., 1996).

How can this happen? What factors compromise an eyewitness's memory? Common sense tells us that brief exposure, long distance, and dim lighting all limit our eyewitnessing abilities. But researchers have uncovered other less obvious problems as well. We now know, for example, that people often have trouble recognizing members of a race other than their own, that the presence of a weapon draws attention and reduces a witness's ability to identify the criminal, and that witnesses who are highly aroused zoom in on central features of an event—say, the culprit or the victim—but then lose the ability to recall other details (Cutler & Penrod, 1995; Loftus, 1996; Thompson et al., 1998).

Sometimes additional problems arise from the way police officers gather evidence from eyewitnesses. One common technique is the live lineup, where the police present their suspect to the witness along with five or six "foils" who are similar in their appearance. There are many structural and procedural aspects of the lineup situation that can lead eyewitnesses to make false identifications (Buckhout, 1974; Wells, 1993). For example, research shows that anything that makes one lineup member more distinctive than the others increases his or her chance of being selected—which may explain the

many identified an innocent person. Other studies have confirmed this basic finding: When witnesses are led to believe that the culprit is in the lineup, the risk of a false identification increases (Stebbley, 1997).

Perhaps the most surprising aspect of eyewitness performance has to do with confidence. In a series of experiments, Gary Wells, Rod Lindsay, and others staged a crime in front of unwary subjects who underwent cross-examination after trying to pick the culprit from mug shots. Other subjects, acting as jurors, watched and rated these witnesses. Time and again, jurors overestimated eyewitness accuracy and could not tell the difference between those who were correct versus incorrect in their identifications (Lindsay et al., 1989; Wells et al., 1979). The problem: subjects are highly influenced by how confident witnesses are, a factor that does not reliably predict accuracy. This last statement is surprising, but studies have shown that the witness who declares, "I am absolutely certain," is not more likely to be right than the one who appears unsure (Wells & Murray, 1984; Penrod & Cutler, 1995; Sporer et al., 1995).

One reason why an eyewitness's confidence is not a reliable indicator of accuracy is that confidence can be raised and lowered by external factors. For example, Wells and Bradfield (1999) found that witnesses given confirming feedback about their false identifications ("Good, you identified the actual suspect") also went on to reinvent their memory of other aspects of the eyewitnessing experience. Compared to witnesses not given feedback, they reported that they had paid more attention to the event, had a better view of the culprit, and found the identification easier to make. These witnesses became more confident about the entire experience

"Psychology and . . ."

These days, some of the most exciting work in all areas of psychology connects basic theories and research, on the one hand, to various real-world applications, on the other. There are many fertile domains of application that animate psychologists. To represent some of these areas, "Psychology and . . ." boxes describe applied research in such areas as health, education, business, law, sports, and the environment. These boxes will enable students to see psychology from an important and enticing other perspective—"out there," in action, and in the public forum.

HOW TO...

Condition Yourself to Break a Bad Habit

Do you need to diet or exercise in order to lose weight? Would you like to stop smoking? Do you have trouble falling asleep at night? Are you painfully shy in groups? Do you spend too much time watching TV? If you answered yes to any of these questions, then you can help yourself with an individualized program of operant conditioning, or "behavior modification." In a "how to" book on using operant conditioning for personal adjustment, David Watson and Roland Tharp (1996) describe series of steps that will help people reach their own behavioral goals:

1. *Identify the target behavior you want to change.* Make sure you define the problem in precise terms ("I eat too much junk" or "I don't exercise enough"), not in terms that are general and hard to pin down ("I am overweight").
2. *Record your baseline.* First, measure your current behavior level to get a baseline. If overeating is the problem, count the number of calories you consume in a seven-day period. If smoking is the problem, write down how many cigarettes you smoke each day. Keep careful written records so you can chart your progress, say on a graph. Also take note of the stimulus conditions in which the problem behavior occurs (where you are, what you're doing, and who you're with) and the effects it has (so you can see how it is being reinforced).

3. *Formulate your plan.*

■ To extinguish an unwanted behavior, you should either avoid the situations in which the behavior tends to occur or remove the reinforcements that sustain it. If, for example, you tend to overeat while talking on the kitchen telephone or watching TV, it would help to spend less time in these situations. To ensure that you follow through, the punishment should not be too severe.

4. *Implement the plan.* Once you start, keep a log of the frequency of the target behavior. If you see no improvement, reexamine the program (the reinforcer may be too weak, or you may have set goals that are too high or too easy to reach). If you need to boost your commitment, make a behavioral "contract" in front of friends.
5. *Maintain the change.* Once you reach your goal, the key is to stay there. It's better to phase the program out gradually rather than all at once. You can do this by lowering the reinforcement-to-behavior ratio until, eventually, the reinforcement is no longer necessary.

"How to..."

As all instructors know, students often wonder and ask about the personal relevance of psychology to their own well-being. "How to..." boxes are specifically designed to answer this question by describing some of the ways in which students can use psychology to improve aspects of their own lives. Practical advice is thus presented on a whole range of matters.

"Through the Global Window..."

Inspired by psychology's recent explorations into the study of human cultures, and racial and ethnic groups, "Through the Global Window" boxes focus on fundamental questions about universals in human nature—and the ways in which people throughout the world are both similar and different.

THROUGH THE GLOBAL WINDOW...

Cultural Influences on Achievement

As a consequence of the nature-nurture controversy, researchers have long been interested in comparing different racial, ethnic, and social groups. Most recently, the career achievements of Asian-American immigrants—particularly in high-tech industries—raised the nature-nurture questions once again. Relative to other groups, Asian-American students get higher grades and SAT math scores, are more likely to graduate from college, and are more likely to win National Merit Scholarships, Westinghouse Science Talent Searches, and Presidential Scholarships. The news media thus have referred to Japanese, Chinese, Korean, Vietnamese, Filipino, and Asian Indian students collectively as "The New Whiz Kids" (Sue & Okazaki, 1990).

Are Asian Americans, in general, smarter than other groups? Flynn (1991) analyzed more than a dozen IQ studies and found that despite the remarkable record of Asian Americans, their test scores were about average. Looking at IQ and employment statistics, Flynn went on to calculate that Chinese Americans as a group are just as successful as white Americans would be if they had an average IQ of 120—a pattern of "overachievement" that begs for an

explanation. In a series of studies, Harold Stevenson and others (1990, 1993) compared children in a wide range of schools in Taiwan, Japan, and the United States and found that by the fifth grade, Asian students were superior in number concepts, computation, word problems, and other aspects of math. However, the Asian students also found the schoolwork more difficult, were less confident of their own skills, and were less favorably evaluated by parents and teachers. In other words, American children and adults were more satisfied than Asians were despite lower levels of achievement (Crystal & Stevenson, 1991).

Additional studies have shown that the Asian advantage in math continues into high school, where Taiwanese and Japanese students outperform Americans in algebra, geometry, trigonometry, and calculus (Chen & Stevenson, 1995). At this level, too, there are marked cultural differences in the values placed on academics. When high-school students in the three countries were asked to account for their time, the differences were striking. As shown in Figure 12.13, students in Taiwan

DEBUNKING THE MYTH...

of Right-Brain Education

For years, the popular press has been playing up differences between the right and left brain. Magazine writers advise parents to have their children tested to see whether they are "right-brained" or "left-brained" thinkers so that teachers can customize their lessons. Others focus on people from different occupational groups, claiming that artists and poets use the right hemisphere more than lawyers and chemists do. Some even associate the left hemisphere with rational, technological Western thought—in contrast to the more intuitive, sometimes mystical, Eastern ways of thinking. From the popular press, you'd think that we humans each had two brains and could choose to use one or the other as needed.

This overly simplistic view has often been applied to the field of education. Browse the shelves of your local bookstore, and you'll see paperback titles such as *Whole-Brain Thinking*, *Educating the Right Brain*, *The Other Side of the Mind*, and *Right Brain Manager: How to Harness the Powers of Your Mind to Achieve Personal and Business Success*. You can even buy self-help tapes and attend seminars to help unleash your "un-

known" potential, and photography. In her bestseller, *Drawing on the Right Side of the Brain*, art teacher Betty Edwards (1979) claimed that although the right hemisphere gives us the ability to draw, many people find it difficult to copy familiar scenes or objects because they automatically label and analyze the material. To reduce this sort of interference from the left hemisphere, she recommended that students view the pictures to be copied upside down so the pictures cannot be recognized and labeled. According to Edwards, this simple exercise improves the quality of drawings that are rendered.

Discussions of right-brain education have sparked excitement over the years. These concepts have been applied in the business world, too, where consultants offer to measure thinking styles and retrain workers as a way to improve their performance (Herrmann, 1996). The problem is, there is very little scientific evidence to support these applications of split-brain research (Hellige, 1990; Springer & Deutsch, 1998; Corballis, 1999). [That, however,] "did not stop the myth-makers, who greeted the right brain as though it were some long-lost but exotic uncle" (Corballis, 1999).

"Debunking the Myth..."

These boxes present popular conceptions about people, the mind, and behavior, or conclusions prematurely drawn from early research for which there is no empirical support. It's my hope that "Debunking the Myth" boxes will encourage students to reflect on—and reevaluate—their own intuitive theories, beliefs, and commonsense conceptions on a whole range of psychological matters.

Study Aids

Preparing students for what they are going to read and then asking them questions about that material as they read can facilitate the learning and retention of concepts. Accordingly, each chapter is structured to help students master the material as they move from one major section to the next.

Preview questions introduce the areas of inquiry upcoming in each major section.

Review questions at the end of every major section challenge students to recall and apply important concepts before moving on to the next section.

Big Picture overviews at the end of each chapter provide a brief narrative overview of the main points. This final section is designed to encourage the reader to step back from the theories, research findings, and other fine details contained within the chapter, and refocus from a wider angle on the “big picture” questions initially raised in *What’s Your Prediction?*

End of Chapter materials provide a final review for students. Each of these sections begins with a detailed, section by section, **Summary** and a list of **Key Terms**. These are followed by a series of questions entitled **Thinking Like a Psychologist**, which challenge students to think critically and to apply the major concepts discussed in the chapter.

Internet Resources are also provided so that interested students can approach the world as a psychologist would—inside the classroom and out, when they’re reading this book, and when they’re not. These resources consist of Web sites that students can access for more information of relevance to the chapter. These resources are also listed on the Companion Website that accompanies *Psychology*, Third Edition.

Abundant graphic presentations are presented throughout this text. Tables, figures, photographs, hands-on exercises, cartoons, factoids, quotations, and survey results have all been carefully selected to illustrate important principles.

Detailed subject and author indexes.

References A complete list of more than two thousand text citations.

What’s New

From one area to the next, this book is remarkably up to date. I have taken a fresh look at the latest theoretical and research developments within each and every chapter. In doing so, I have tried to strike a balance between “classics” from psychology’s historical warehouse and new studies hot off the presses. But my main goal is to describe the state of psychology *today*—and to do so in a way that is responsible. As in any text, the scholarship must be accurate and current. Therefore, the more than six hundred new references rely most heavily on research appearing in high-quality journals. In particular, I’d like to draw your attention to the following topics, which are either new to this edition or have received expanded coverage:

- Women and minorities in the history of psychology (Chapter 1)
- Sociocultural perspectives in psychology (Chapter 1)
- Sports-related head injuries (Chapter 2)
- Phantom pain (Chapter 2)
- Neurogenesis (Chapter 2)
- Influence without awareness (Chapter 4)

- Ironic effects of mental control (Chapter 4)
- Classical conditioning of the immune system (Chapter 5)
- False memories (Chapter 6)
- Animal cognition (Chapter 7)
- Benefits of cognitive heuristics (Chapter 7)
- Origins of homosexuality (Chapter 8)
- Happiness and subjective well-being (Chapter 9)
- Cultural influences on emotion (Chapter 9)
- Infants' sensitivity to number (Chapter 10)
- Effects of peer rejection in childhood (Chapter 10)
- Risk-taking in adolescence (Chapter 11)
- Midlife crisis and satisfaction (Chapter 11)
- Adulthood changes in time perspective (Chapter 11)
- Development of expertise (Chapter 12)
- The Mozart Effect (Chapter 12)
- Stereotype threat effects on performance (Chapter 12)
- Automatic and unconscious social influences (Chapter 13)
- School violence (Chapter 13)
- Ethnic identity conflict (Chapter 14)
- Implicit stereotyping (Chapter 14)
- Contemporary studies of unconscious defensive processes (Chapter 15)
- Social anxiety (Chapter 16)
- Use of virtual reality exposure in systematic desensitization (Chapter 17)
- Proactive forms of coping with stress (Chapter 18)

Coverage of Human Diversity

Psychologists have always been fascinated by differences—among cultures, among racial and ethnic groups within cultures, and between men and women. As we enter the twenty-first century, this topic is generating a great deal of scientific interest and controversy. These topics are addressed, as appropriate, throughout this text. Similarities and differences are thus noted in perception, emotion, reasoning, intelligence, child and adult development, social behavior, the structure of personality, and psychopathology. Group similarities and differences are also presented throughout the text in newly written boxes headed “Through the Global Window.”

In order to bring together the most important new work in the area of human diversity, I have also dedicated an entire chapter to this subject. Chapter 14, entitled “Social and Cultural Groups,” examines such topics as cultural differences between East and West, stereotyping, prejudice, racism in America, and gender similarities and differences. As this chapter reveals, “Everyone is basically the same, yet no two people are alike.”

A Capstone Chapter

All introductory psychology texts that I’ve seen come to an end on whatever happens to be the final word of the last substantive chapter. Typically, no effort is made to integrate the material or to provide students with a sense of closure. A feature unique to this text is a closing “capstone” chapter that brings together the various areas of psychology on a hot topic that is dear to everyone’s health: health and well-being. Following an initial discussion of “mind over matter,” Chapter 18 presents the latest research on the self, the health implications of self-awareness and self-deception, the processes of stress and coping, and the exciting new work in the area of psychoneuroimmunology. As noted in this final chapter, “The

mind is a powerful tool. The more we know about how to use it, the better off we'll be."

Statistical Appendix

For those who wish to analyze research results using descriptive and inferential statistics, this appendix clearly leads students, step by step, through methods of describing data, measures of central tendency and variability, the normal distribution, correlations, *t* tests, and the analysis of variance.

The Supplements Package

For the Instructor

Instructor's Resource Manual: Prepared by Alan Swinkels of St. Edward's University and Traci Giuliano of Southwestern University, this manual contains a wealth of material to help you plan and manage your course, including: chapter overviews, detailed lecture suggestions and outlines, lecture "launchers," learning objectives, demonstrations and activities, teaching tips, suggestions for student projects, transparency suggestions, and video resources for each chapter. Also included in this edition's IRM is material to guide you on how to assign and use the text-specific companion website, The Psychology Place website, and the Mind Matters CD-ROM that accompany this edition of *Psychology, Third Edition*.

Test Item File: Prepared by John Caruso of the University of Massachusetts at Dartmouth, this test bank contains over 3,000 multiple choice, true/false, short-answer and essay questions that test factual, applied and conceptual knowledge.

Prentice Hall Test Manager: One of the best-selling test-generating software programs on the market, Test Manager is available in Windows and Macintosh formats and contains a Gradebook, Online Network Testing and many tools to help you edit and create tests. The program comes with full Technical Support and telephone "Request a Test" service.

Prentice Hall's Introductory Psychology Transparencies, Series V: Designed in large-type format for lecture settings, these full-color overhead transparencies add visual appeal to your lectures by augmenting the visuals in the text with a variety of new illustrations.

Powerpoint Slides and Online Graphics Archive: Available in the Faculty Module of the Companion Website at www.prenhall.com/Kassin, each chapter's art has been digitized and is available for download into any presentation software. Powerpoint lectures for each chapter are also available for download.

Prentice Hall Video Libraries: Prentice Hall has assembled a superior collection of video materials which range from short lecture launchers to full-length detailed features for use in the Introductory Psychology course. The videos below are available to qualified adopters.

- **ABC News Videos for Introductory Psychology, Series III** consists of segments from ABC Nightly News with Peter Jennings, Nightline, 20/20, Prime Time Live, and The Health Show. A summary and questions, designed to stimulate

ABCNEWS

critical thinking for each segment, are included in the Instructor's Resource Manual.

- ***The Alliance Series: The Annenberg/CPB Collection*** is the most extensive collection of professionally produced videos available with any introductory psychology textbook. Selections include videos in the following Annenberg series: *The Brain*, *The Brain Teaching Modules*, *Discovering Psychology*, *The Mind*, and *The Mind Teaching Modules*.
- ***Films for the Humanities and Sciences*** A wealth of videos from the extensive library of Films for the Humanities and Sciences, on a variety of topics in psychology, are available to qualified adopters. Contact your local Prentice Hall representative for a list of videos.

Teaching Psychology, Second Edition by Fred W. Whitford serves as a guide to manage the myriad complex tasks required to teach Introductory Psychology effectively from the start. The Second Edition has been updated to include coverage of the regional teaching of psychology conferences and organizations, and a new section on using the Internet and online services to enhance teaching.

Media Support for *Psychology, Third Edition*

Both Professors and Students will find many useful resources in the media program to accompany this text.

www.prenhall.com/kassin Companion Website: This FREE online *Study Guide* allows students to review each chapter's material, take practice tests, research topics for course projects, and more. Professors should visit the Faculty Module of the site to download electronic versions of the Instructor's Resource Manual, Powerpoint Slides for each chapter, and an Online Graphics Archive.

The Psychology Place, Special Edition: This premier web resource for Introductory Psychology provides interactive learning activities, practice tests, "Best of the Web" site listings, current research news, an online glossary, FAQs about Psychology and other resources. Students get their subscription with the purchase of a new textbook; faculty get their subscription upon adoption of this text.

Mind Matters CD-ROM: Free when packaged with a new text, *Mind Matters* features interactive learning modules on history, methods, biological psychology, learning, memory, sensation and perception. Each module combines text, video, graphics, simulations, games and assessment to reinforce key psychological concepts.

On-Line Course Management: For professors interested in using the Internet and on-line course management in their courses, Prentice Hall offers fully customizable on-line courses in WebCT, BlackBoard and eCollege to accompany this textbook. Contact your local Prentice Hall Representative or visit www.prenhall.com/demo for more information.

For the Student

Study Guide: Prepared by Pamela Regan of California State University, Los Angeles, this student workbook is available to help students master the core concepts in each chapter. Incorporating key graphics and illustrations from the book,

every chapter contains an overview and outline, learning objectives, key terms, matching or labeling exercises, practice multiple-choice and true/false test questions, and practice essay questions with brief guidelines for correct answers. Each chapter also includes a guide to *The Psychology Place*, and the activities on the site that reinforce each chapter's key concepts.

Psychology on the Internet: This “hands-on” Internet tutorial features Web sites related to psychology and general information about using the Internet for research. This supplement is available FREE when packaged with the text and helps students capitalize on all the resources that the World Wide Web has to offer.

Supplementary Textbooks Available for Packaging

The following workbooks and supplementary textbooks are available in specially discounted packages with the textbook or as stand-alone supplements:

Forty Studies that Changed Psychology, Third Edition by Roger Hock of Mendocino College presents forty seminal research studies that have shaped modern psychological study. This paperback supplement provides an overview of each ground-breaking study, its findings, the impact these findings have had on current thinking in the discipline, and the most notable extensions and follow-up studies.

How to Think Like a Psychologist: Critical Thinking in Psychology, Second Edition by Donald McBurney of the University of Pittsburgh. This brief paperback uses a question-and-answer format to explore some of the most common questions students ask about psychology.

The Psychology Major: Careers and Strategies for Success by Eric Landrum, Idaho State University; Stephen Davis, Emporia State University; and Terri Landrum, Idaho State University. This brief paperback provides valuable information on career options available to psychology majors, tips for improving academic performance, and a guide to the APA style of research reporting.

Experiencing Psychology, by Gary Brannigan, SUNY, Plattsburg. This hands-on activity book contains 39 active-learning experiences corresponding to major topics in psychology to provide students experience in “doing” psychology.

Acknowledgments

Iwant to thank Roberta Meyer, my developmental editor, for her tireless efforts and insights when our time was most pressured. I also want to thank Eloise Donnelly and Barbara Salz for their help in locating the often striking photographs that adorn the pages of this book. I am also grateful to the production staff at Prentice Hall for their commitment to excellence. Look through this book and you'll see why I am indebted to those responsible for the design, artwork, and other aspects of production.

I want to thank Pamela C. Regan for writing the excellent Study Guide that accompanies this book, Alan Swinkels and Traci Giuliano for writing the Instructor's Manual, John Caruso for his work on the Test Bank, and Lynne Blesz-Vestal for her work on the Companion Website.

Finally, I could never have written this textbook without the many thoughtful reviews provided by friends and colleagues at other institutions. Through the various stages of each edition, these teachers and scholars gave me invaluable insights, corrections, references, examples, and alternative points of view—all of which helped make me a better author and this a better book. For their expertise and generosity, I thank:

Eugene Abravanel, *George Washington University*
 Lewis R. Aiken, *Pepperdine University*
 Tony Albiniak, *University of South Carolina—Coastal Carolina College*
 Larry M. Anderson, *Kwantlen College*
 Virginia Andreoli Mathie, *James Madison University*
 James R. Averill, *University of Massachusetts—Amherst*
 Gregory F. Ball, *Johns Hopkins University*
 Marie Banich, *University of Illinois at Urbana-Champaign*
 Judith Barker, *Cuyahoga Community College*
 Patricia Barker, *Schenectady Community College*
 Carol M. Batt, *Sacred Heart University*
 Joe S. Bean, *Shorter College*
 Robert C. Beck, *Wake Forest University*
 Charles Blaich, *Wabash College*

Saul Kassin

About the Author

Saul Kassin is Professor of Psychology at Williams College in Williamstown, Massachusetts. Born and raised in New York City, he graduated with a B.S. from Brooklyn College in 1974. He received his Ph.D. in personality and social psychology from the University of Connecticut in 1978. He then spent one year at the University of Kansas and two at Purdue University. He was awarded a prestigious U.S. Supreme Court Judicial Fellowship in Washington, D.C., and then worked as a postdoctoral fellow in the Psychology and Law Program at Stanford University.

Kassin is coauthor of *Social Psychology* (now in its 4th edition). He has also authored or edited six other books and has written numerous articles on the topics of attribution theory, social and cognitive development, and applications of psychology to jury decision-making, eyewitness testimony, confession evidence, and other aspects of law. He has served on the editorial boards of several major journals.

Away from work, Kassin has coached youth baseball. He has an insatiable appetite for sports, politics, rock 'n' roll, travel, and ethnic food.

Preface xii

About the Author xxiii

1

Introducing Psychology and Its Methods 2

What's Your Prediction?

Thinking Like a Psychologist 3

What Is Psychology? 4

Historical Roots 4

HOW TO . . . :

Think Critically About the Experts 5

Expansion of Psychology's Horizons 10

Practical Applications 12

A Diversity of Perspectives 14

Scientific Methods 15

Research Settings 16

Psychological Measurements 17

Research Designs 19

Ethical Dilemmas 26

Psychology Today 29

Biological Perspectives 30

Sociocultural Perspectives 31

Thinking Like a Psychologist 32 • Summary
34 • Key Terms 36 • Internet Resources 37

2

Behavioral Neuroscience 38

What's Your Prediction?

One Brain or Two? 39

The Body's Communication Networks 41

The Nervous System 41

The Endocrine System 42

The Neuron 43

Structure of the Neuron 45

The Neuron in Action 45

How Neurons Communicate 46

Neurotransmitters 47

The Brain 49

Tools of Behavioral Science 49

Regions of the Brain 53

The Split Brain 60

PSYCHOLOGY AND . . . HEALTH:

Being Left-Handed in a Right-handed World 61

DEBUNKING THE MYTH . . . :

of Right-Brain Education 68

Prospects for the Future 69

The Brain's Capacity for Growth
and Reorganization 70

Repairing the Damaged Brain: New Frontiers 72

PSYCHOLOGY AND . . . SPORTS:

Head Injury in Contact Sports 73

PSYCHOLOGY AND . . . HEALTH:

Neurogenesis in Adults 75

The Big Picture 76 • Summary 76 • Key
Terms 78 • Thinking Like a Psychologist 79
• Internet Resources 79

3

Sensation and Perception 80

What's Your Prediction?

Does Culture Influence Depth Perception? 81

Measuring the Sensory Experience 83

Absolute Thresholds 84

Signal-Detection Theory 84

Difference Thresholds 85

Sensation 86

Vision 86

Hearing 95

PSYCHOLOGY AND . . . HEALTH:

When Is Loud Too Loud? 99

Other Senses 100

THROUGH THE GLOBAL WINDOW . . . :

Cultural Differences in Smell 103

Keeping the Signals Straight 109

Perception 110

Perceptual Organization 110

Perceptual Constancies 112

Depth and Dimension 113

Perceptual Set 117

The World of Illusions 118

Extrasensory Perception 121

The Case for ESP 121

The Case against ESP 122

The Continuing Controversy 123

The Big Picture 124 • Summary 124 • Key
Terms 126 • Thinking Like a Psychologist
127 • Internet Resources 127

4

Consciousness 128

What's Your Prediction?

Do Subliminal Self-Help Tapes Work? 129

Attentional Processes 130

Selective Attention 131

Divided Attention 132

Influence without Awareness 134

DEBUNKING THE MYTH . . . :

*that Consumers are Manipulated
by Subliminal Ads* 136

Sleep and Dreams 137

The Sleep-Wake Cycle 137
Night Work, Sleeping, and Health 140
The Stages of Sleep 141
Why Do We Sleep? 144
Dreams 146

THROUGH THE GLOBAL WINDOW . . . :

What People Dream About 149
Sleep Disturbances 150

HOW TO . . . :

Overcome Insomnia 151

Hypnosis 153

The Seeds of Controversy 155
The Hypnotic Induction 155
Hypnotic Responsiveness 156
The Myths and Realities 156
Is Hypnosis an “Altered” State? 158

PSYCHOLOGY AND . . . LAW:

Can Hypnosis Enhance Eyewitness Testimony? 159

Consciousness-Altering Drugs 161

Sedatives 163
Stimulants 165
Hallucinogens 165
Opiates 166

Consciousness and Control 167

**The Big Picture 168 • Summary 168 • Key
Terms 170 • Thinking Like a Psychologist
171 • Internet Resources 171**

5 Learning 172

What’s Your Prediction?

***Can People Learn Without Realizing It?* 173**

Classical Conditioning 176

Pavlov’s Discovery 176
Basic Principles 178
Pavlov’s Legacy 180

PSYCHOLOGY AND . . . HEALTH:

*Can the Immune System Be Classically
Conditioned?* 185

Operant Conditioning 186

The Law of Effect 187
The Principles of Reinforcement 187
Practical Applications of Operant
Conditioning 195

HOW TO . . . :

Condition Yourself to Break a Bad Habit 197
New Developments in Operant Conditioning 198

Observational Learning 201

Studies of Modeling 201

The Process of Modeling 202

**The Big Picture 203 • Summary 204 • Key
Terms 205 • Thinking Like a Psychologist
206 • Internet Resources 207**

6 Memory 208

What’s Your Prediction?

***Can a Memory Be Created?* 209**

An Information-Processing Model 211**The Sensory Register 212**

Iconic Memory 213
Echoic Memory 213

Short-Term Memory 214

Capacity 215
Duration 216
Functions of Short-Term Memory 218

Long-Term Memory 221

Encoding 221
Storage 223
Retrieval 229
Forgetting 236

HOW TO . . . :

Improve Your Memory 240
Reconstruction 242

PSYCHOLOGY AND . . . LAW:

Eyewitness Identification Biases 245

Autobiographical Memory 246

What Events Do People Remember? 247
The Self as Personal Historian 249

**The Big Picture 251 • Summary 251 • Key
Terms 254 • Thinking Like a Psychologist
254 • Internet Resources 255**

7 Thought and Language 256

What’s Your Prediction?

***Using Words to Shape Thoughts* 257**

Concepts 258**Solving Problems 260**

Representing the Problem 260
Generating Solutions 264
“Blind Spots” in Problem Solving 267

Making Judgments 269

The Rules of Formal Logic 269
Biases in Judgment 271

DEBUNKING THE MYTHS . . . :

that Cause Gamblers to Lose Money 273
Can Heuristics Make Us Smart? 276

Language 277

HOW TO . . . :

- Improve Your Critical Thinking Skills* 278
- Communication in the Animal World 278
- Characteristics of Human Language 279
- Can Animals Learn Language? 283

The Relationship Between Thought and Language 287

- The Linguistic-Relativity Hypothesis 288

THROUGH THE GLOBAL WINDOW . . . :

- Culture, Language, and the Way We Think* 289
- Psychological Impact of Sexist Language 290

The Big Picture 291 • Summary 292 • Key Terms 294 • Thinking Like a Psychologist 294 • Internet Resources 295

8**Motivation 296*****What's Your Prediction?******What Does It Take to Motivate People at Work? 297*****What Motivates Us? 299**

- General Theories of Motivation 299
- The Pyramid of Human Motivations 300

Basic Human Motives 301

- Hunger and Eating 302
- Sexual Motivation 308

THROUGH THE GLOBAL WINDOW . . . :

- Culture, Race, and Conceptions of Body Weight* 309

Social Motives 315

- Belongingness Motives 315
- Esteem Motives 318

PSYCHOLOGY AND . . . EDUCATION:

- Can Fantasy Play Increase Students' Motivation to Achieve?* 320

Motivating People at Work 322

- Reward-Based Motivation 322
- Intrinsic Motivation 323
- Equity Motivation 324

The Big Picture 325 • Summary 325 • Key Terms 327 • Thinking Like a Psychologist 327 • Internet Resources 327

**9****Emotion 328*****What's Your Prediction?******Can Culture Influence Emotion? 329*****The Physiological Component 330**

- A Historical Perspective 330
- Brain Centers of Emotion 331

Generalized Autonomic Arousal 332

Specific Patterns of Arousal 334

PSYCHOLOGY AND . . . LAW:

The Lie-Detector Test 335

The Expressive Component 337

- Nonverbal Communication 337
- Sensory Feedback 340

The Cognitive Component 341

- Schachter's Two-Factor Theory of Emotion 342
- Dimensions of Appraisal 344
- Counterfactual Thinking 345
- Is Cognition Necessary? 345

Human Emotion: Putting the Pieces Together 348

- Types of Emotions 348
- Dynamics of Emotion 349
- Are There Sex Differences in Emotion? 350

THROUGH THE GLOBAL WINDOW . . . :

- Cultural Differences in Emotion* 351
- Pleasure and the Pursuit of Happiness 352

The Big Picture 356 • Summary 357 • Key Terms 358 • Thinking Like a Psychologist 359 • Internet Resources 359

10**Infancy and Childhood 360*****What's Your Prediction?******Nature or Nurture? 361*****Basic Developmental Questions 362**

- The Nature-Nurture Debate 363
- Developmental-Research Strategies 367

The Unborn Child 368

- Genetic Building Blocks 368
- Prenatal Development 369

PSYCHOLOGY AND . . . HEALTH:

- Do Drugs Affect the Fetus?* 372
- The Birth Experience 374

The Remarkable Newborn 375

- Reflexes 376
- Sensory Capacities 377
- Sensitivity to Number 379

The Infant and Growing Child 380

- Biological Development 381
- Cognitive Development 383

PSYCHOLOGY AND . . . LAW:

- Are Child Witnesses Competent to Testify?* 391
- Social Development 394

THROUGH THE GLOBAL WINDOW . . . :

- Cultural Differences in Infant Care* 397

The Big Picture 402 • Summary 402 • Key Terms 404 • Thinking Like a Psychologist 404 • Internet Resources 405
