INTRODUCTION

Since the 1980s, the Novell company has been the leader in Local Area Network (LAN) technology, with its NetWare products controlling over 60% of the market. The rapid growth of LANs during the 1990s has produced a need for larger and more powerful network systems. Novell has responded to this expanding need by developing the NetWare 4 system. NetWare 4 contains many features that make it a more efficient and reliable system for implementing large and diverse networks.

Being able to find qualified people who have the knowledge necessary to install and manage a LAN is a major problem facing many businesses in the 1990s. In order to help businesses be assured of hiring competent network professionals, Novell has instituted the Certified NetWare Administrator (CNA) program. To become a CNA, Novell requires that you pass a single CNA certification test for either NetWare 3.12 or NetWare 4.1 at an authorized testing center. Today many companies are looking for network administrators who have passed the CNA exam to implement their NetWare LANs.

Hands-On NetWare 4.1 is intended to provide you with the concepts, commands, and hands-on experience necessary to pass the NetWare 4.1 CNA exam. The approach used in this book is also designed to help you obtain the skills necessary to be able to apply NetWare 4.1 in the development of microcomputer LAN systems in a real office situation. These skills, along with the CNA designation, will put you in a position to take advantage of the many opportunities taking place in the rapidly growing and changing field of networked computing.

Features and Approach

Hands-On NetWare 4.1 sets itself apart from other networking books through its unique hands-on approach and its orientation to real-world situations and problem solving. To ensure that students comprehend how Novell NetWare concepts and techniques are applied in real business organizations, this text incorporates the following features:

Chapter Hands-On Activities. In each chapter, network topics are explained in the context of a case in which students assume the role of the network administrator at the fictitious Universal Aerospace Corporation. As the case scenario progresses, students work in conjunction with a CNA consultant and follow the steps performed by real networking professionals who set up and maintain networks. The case provides students with a strong conceptual foundation, so that when they embark on the hands-on projects integrated into each chapter, they understand them in the context of a real-life network. Completing the chapter hands-on activities is important in order to perform the end-of-chapter projects and complete the Universal Aerospace network system.

Command Summary, Key Terms and Review Questions. Each chapter concludes with meaningful Review Questions that test students' understanding of the concepts and commands presented in the chapter. A Command Summary and a list of Key Terms provide a valuable reference to help students review the material covered in the chapter.

End-of-Chapter Projects. At the end of each chapter, students have the opportunity to reinforce the concepts and techniques learned in the chapter to their own network installation projects. These exercises build on each other from chapter to chapter so that by the end of the book, each student will have setup a functional network environment complete with users, software menus, shared files, and printers. End-of-chapter projects build on each other and as a result you will need to complete the projects at the end of each chapter in order to perform the projects in subsequent chapters and complete the Universal Aerospace network system.

Additional Exercises. In addition to the hands-on projects and end-of-chapter assignments, each chapter also has additional exercises that provide students with the chance to be creative in designing and developing a network system to support the processing needs of another fictitious organization, Superior Technical College. All of the end-of-chapter exercises can be removed from the book and submitted to the instructor to provide a simple and useful way to track the students' progress and understanding. Performing the additional exercises is not necessary to complete projects or exercises in subsequent chapters.

To the Student

In order to complete the projects and set up your own version of the Universal Aerospace network, your instructor has assigned you to a NetWare 4.1 classroom server and given you a user name, password, student reference number, and home directory. Your user name has been granted the privileges necessary for you to build your own network system by creating and managing network objects such as users, groups, printers, and files without affecting other students use of the server. Your home directory is the work area on classroom server where you have been given all rights to create and manage files and directories needed to complete the projects and exercises. In order to perform certain projects you will need a copy of the student work disk containing sample files and applications for Universal Aerospace. The projects at the end of Chapter 1 instruct you how to download a copy of the student work disk from the classroom server.

If you will be performing the hands-on activities and projects on your own computer network, you will need to install NetWare 4.1 on your server and follow the network step instructions provided by your instructor or follow the steps provided in the setup document file found on the student disk.

Text and Graphic Conventions

In addition to the normal discussions within each chapter of this book are icons representing notes, and hands-on exercises:

The Note icons are used to present additional helpful material related to the subject being described.

Each hands-on activity in this book is preceded by the hands-on icon and a description of the exercise that follows.

Located at the end of each chapter is a continuing running case that is indicated by the Project icon. In this extensive case example, students are asked to implement the skills explained in the chapter at the fictitious Universal Aerospace Corporation. For more information on the hands-on exercises in this book, see the features and approach section in this preface.

The Supplements

Instructor's Manual. The Instructor's Manual that accompanies this textbook was written by the author and has been quality-assurance tested. It includes:

- Answers and solutions to all Review Questions and Projects
- A disk containing solutions files from the projects
- Teaching notes containing tips from the author about the instructional progression in each chapter

Student Work Disk. The Student Work Disk contains sample software, files for use in the Universal Aerospace Project, and Review Questions. Adopters of this text are granted permission to distribute these files to any student who purchases a copy of this text. To obtain a student disk, see the inside front or back cover of this book.

File Server Setup Disk. The setup program can copy the contents of the Student Work Disk to the file server. One of the students' first assignments could be to copy the contents of the Student Work Disk onto a blank disk for use in the projects.

Course Test Manager 1.1. Accompanying this book is a powerful assessment tool known as the Course Test Manager. Designed by Course Technology, this cutting-edge Windows-based testing software helps instructors design and administer tests and pre-tests. In addition to being able to generate tests that can be printed and administered, this full-featured program also has an online testing component that allows students to take tests at the computer and have their exams automatically graded.

Acknowledgments

While I have spent a great many hours writing this book, it would never have been completed without the help of many others. I especially owe many thanks to my editor Mary-Teresse Cozzola, whose vision and advice has helped to shape and polish this book into a valuable product. The credit for making this book so useful goes to the Course Technology staff, especially Richard Keaveny and Nancy Ray, who have had the difficult job of coordinating all the tasks and maintaining the schedule despite deadlines that slipped far too often. Thanks is also due to the excellent reviewers including Behrouz Forouzan (De Anza College) and Roger Simerly (Volunteer State Community College) who added important comments and suggestions that I have incorporated into the finished book. I also feel very fortunate to the many testers who performed the complex and detailed job of testing the exercises and verifying the technical content of the materials.

I want to thank my wife Mary whose loving and patient help enabled me to complete this project. In addition, any success this book achieves is ultimately due to my parents, William and Rosemarie, who have made many sacrifices to provide a stable and motivating environment for learning and growing. I would also like to acknowledge Jan Brill, Bert Richard, Tom Lemler, and Lois Eichman at Wisconsin Indianhead Technical College for maintaining our school as a leader in the area of Novell Education. Finally, I would like to dedicate this book to the Computer Information System students at WITC, and other colleges, who are taking on the challenge of becoming computer networking professionals. I hope this text and its exercises will help prepare you to succeed in your goals.

APPENDIX A INSTALLING NETWARE 4.1

APPENDIX B CNA OBJECTIVES

READ THIS BEFORE YOU BEGIN

To the Student

To use this book, you must have a Student Work Disk. See the inside front or inside back cover for details on how to obtain a copy of the Student Work Disk. Since most of the hands-on exercises in this book require access to a file server, your workstation will need to be connected to a network and your instructor will provide you with a valid username on your assigned file server.

To the Instructor

Setting up the classroom file server. To complete the exercises and projects in this book, your students will need to access a classroom file server. Providing student access to the classroom file server involves creating a username and two directories for each student along with copying some sample files and uploading the Student Work Disk. To help you perform the file server setup process, Course Technology, Inc. has provided a special File Server Setup Disk. See the inside front or inside back cover for details on how to obtain copies of the Student Work Disk and the File Server Setup Disk. To setup your classroom file server, follow the instructions in the README file located on the File Server Setup Disk. Complete file server setup instructions are also included at the beginning of your Instructor's Manual.

README File. The README.TXT file located on the File Server Setup Disk provides additional notes on performing the file server setup process. You can view the README.TXT file using any word processor or text editor.

System Requirements

The minimum software and hardware requirements for each network lab computer are as follows:

- Windows 3.1 or higher
- A 386 or higher processor with a minimum of 4 MB of RAM (486 recommended)
- VGA monitor
- A network card cabled to the classroom file server
- A hard disk drive with 10 MB free is highly recommended
- NetWare client software necessary to log in to the file server
- DOS v5.0 or higher (if the computer has a hard drive, DOS should be installed on the hard drive)
- At least one high density disk drive

The minimum file server hardware requirements are as follow:

- A 486 or higher computer system with a minimum of 16 MB of RAM
- A volume with at least 4 MB free for each student's directories
- At least 100 MB disk space for the SYS volume, sample files and print queues

TABLE OF CONTENTS

CHAPTER ONE

Networking Basics	1
Network Components	2
Client Computers	2
Servers	4
Volumes	8
Printers	8
Network Cables	9
Network Topology	12
Network Interface Cards	15
Popular Protocol Stacks	20
