**DIFFERENTIABILITY AND
FRACTALITY IN DYNAMICS
OF PHYSICAL SYSTEMS**

*The true sign of intelligence
is not knowledge but imagination.*

Albert Einstein

Preface

This monograph is a collection of ideas developed by several authors on differentiability and fractality, taken as basic frames of approaching the study of physical systems dynamics. Here are some results we want to put into evidence, together with the specific “arsenal” of methods and procedures.

Using the 1-forms in Cartan sense theory, we are offering an elegant procedure of analyzing the motion, in order to obtain the main results of the theory of relativity, and some new results as well. This way, the form of the inertia transformations — *i.e.* the geometric structure of the space-time “aggregate” — is not at all prejudiced. In other words, the irreducible attributes of motion of a body, two bodies, or a solid rigid are dependent on a set of Euclidean invariants. Within such an approach, without abandoning the space-time standard frame, gravitation is re-found as an inertial mass interaction. In addition, a repulsive interaction — responsible for Hubble’s dilatation — is found; this interaction is very sensitive at intergalactic distances.

The wave-corpuscule duality, reducible to the equivalence of two 1-forms, inertial and ondulator, imply motions on curves of constant informational energy. This way not only quantization is statuated, but also dynamics implying velocity limits — not necessarily the speed of light in vacuum.

Motion of a charged particle in a combined field (composed by an electromagnetic and a magnetic constant fields) mimes by numeric

simulation not only various scenarios of evolution towards chaos (period doubling, bifurcations on subharmonics, etc.), but also pattern generation (motion on stationary orbits, etc.). Under these circumstances, trajectories are continuous and non-differentiable curves (fractal curves), and this fact imposes a new space-time geometry, *i.e.* the fractal geometry.

There is also developed a dynamics of the physical object in a fractal space-time, together with some instructive and expressive applications: the fractal model of the atom, the potential gap, the linear harmonic oscillator, the free particle, Heisenberg's uncertainty relations, etc.

The physical systems that display chaotic behavior are recognized to acquire self-similarity and manifest strong fluctuations at all possible scales. Since fractality appears as an universal property of these systems, it is necessary to construct a new physics, either through non-differentiability (Nottale's scale relativity model), or through fractional derivative (fractional physics model). In the first variant, an extended model of Nottale's theory (Scale relativity theory with an arbitrary constant fractal dimension) is established and some applications (fractal model of the atom, particle in a box, harmonic oscillator and free particle) are given. In the second variant, the theory of fractional scale relativity and some applications (fractal covariant mechanics induced by modified scale laws, fractional Schrödinger equation, and emergence of complex gravity) are obtained and discussed.

At the end of this introductory presentation we want to emphasize the fact that our endeavor is addressed to researches, scientists and all those working in the field. Even if this book is not a textbook, it can successfully be used by MSc and PhD students interested in this unlimited and fascinating subject.

The authors express their gratitude to Professor Ieronim Mihaila, from the Faculty of Mathematics, University of Bucharest, for his competent advice during elaboration of the book.

* * *

We dedicate this monograph to the memory of Professor Octav Onicescu, prominent researcher and scientist, member of the Romanian Academy.

The Authors
Iasi, November 2014

Contents

<i>Preface</i>	vii
1. Principles of Motion in Invariantive Mechanics	1
1.1 The Euler-Lagrange and Hamilton's equations obtained by means of exterior forms	1
1.2 The Cartan motion principle	4
2. Inertial Invariantive Motion of the Material Point	7
2.1 Preliminaries	7
2.2 Inertial motion of the particle (material point) . .	7
2.3 The Minkowski-Einstein universe. The Lorentz metric and Lorentz transformations	13
2.4 The anti-Minkowski type Universe	16
2.5 Inertial motion of the particle in the Minkowski-Einstein type universe	16
3. Field Invariantive Theories	19
3.1 Preliminaries	19
3.2 Linear field theory	19
3.3 Nonlinear field theory	28
3.4 Comments of Maxwellian and anti-Maxwellian type fields	31

4.	Ondulatory Invariantive Theories.	
	Wave-Corpuscule Duality	35
4.1	Preliminaries	35
4.2	Linear wave theory	35
4.3	Minkowskian formulation of the ondulatory linear theory	38
4.4	De Broglie's linear theory	39
4.5	The de Broglie-Takabayashi theory	41
4.6	Hamilton-Jacobi equation associated with the motion of a particle in various fields.	
	Correspondence with de Broglie's theory	47
5.	Invariantive Mechanics of Systems of Material Points	49
5.1	Euclidean invariants and the principle of motion .	49
5.2	Conservation laws	51
5.3	Expressions for linear momenta	52
5.4	Expression for energy	53
5.5	The inertial masses	55
5.6	The two-body problem in Newtonian mechanics . .	58
5.7	The two-body problem in general relativity	63
5.8	The motion of light in fields with Schwarzschild metric	67
5.9	The two-body problem in invariantive mechanics.	
	The perihelion advance	72
5.10	Hubble's law	80
5.11	Invariantive mechanics and interactions between bodies	81
5.12	One-body problem in invariantive mechanics . . .	82
6.	The Photon in Invariantive Ondulatory Theories	91
6.1	The red shift	91
6.2	The photon deflection	92
6.3	Fermat's principle. Gravitational retardation of light	95

7. Lagrangian Approach in Invariantive Mechanics	99
7.1 Preliminaries	99
7.2 Construction of the Lagrangian	100
7.3 Infragalactic metrics	101
7.4 Differential equation of infragalactic motion	103
7.5 Planetary perihelion advance	105
7.6 Deflection of light in gravitational field	105
7.7 The red shift of spectral lines in strong gravitational fields	106
7.8 Delay of laser echo	106
8. Considerations on Invariantive Mechanics	109
8.1 Preliminaries	109
8.2 Mass of gravitational interaction	113
8.3 Hubble's effect	114
8.4 Invariantive model with epoch-dependent G	115
8.5 Hubble's effect in the high-speed approximation	117
8.6 Invariantive models of the Universe :	118
8.7 Generalized Lorentz transformations. Critical mass of the universe	119
8.8 Laws of variation of mass with time in invariantive mechanics	120
9. Invariantive Mechanics of Rigid Body	125
9.1 General considerations	125
9.2 Rigid body kinematics	125
9.3 Inertia tensor of the rigid body	127
9.4 Equations of motion of the rigid body	128
9.5 Homogeneous and isotropic rigid body	132
9.6 Rigid body with continuous mass distribution	134
9.7 Eulerian rigid body	138
9.8 Motion in a field of the rigid body	140
9.9 Calculation of invariantive potentials	142
9.10 Space of corpuscles	143
9.11 Classification of corpuscles	145

10. Covariant Formulation of Conservation	
Laws in Invariantive Mechanics	147
10.1 Conservation laws for one material point	147
10.2 Equations of conservation for a discrete system of material points	148
10.3 Four-dimensional formulation of the conservation laws	150
11. Invariantive Mechanics and Informational	
Energy	153
11.1 Preliminaries	153
11.2 The group $SL(2R)$ and the canonical formalism . .	153
11.3 Informational entropy. Transitivity varieties	156
11.4 Onicescu informational energy and uncertainty relations	159
11.5 Onicescu informational energy of the harmonic oscillator	160
11.6 Onicescu informational energy of a system of coupled oscillators	162
11.7 Observable quantities and Onicescu informational energy	166
11.8 Onicescu informational energy of the free particle	167
11.9 Informational energy during the process of interaction neutron — crystal net	168
11.10 Onicescu informational energy and invariantive mechanics	176
References (Chapers 1–11)	177
12. Chaos Via Fractality in Gravitational	
Dynamical Systems	181
12.1 Introduction	181
12.2 Gravitational Maxwell-type equations	182
12.3 Equations of motion and their numerical solutions	185
12.4 Analysis of the Lyapunov exponent	196

12.5	Bifurcation diagram	200
12.6	Fractal analysis	203
12.7	Conclusions	206
	References (Chapters 12)	206
13.	Fractality at Small Scale. Fractal Model of the Atom	209
13.1	Introduction	209
13.2	Nottale's model of the scale relativity theory . . .	210
13.3	Extended model of the scale relativity	212
13.4	The dissipative approximation of motion in fractal structures. Fractal model of the atom	218
13.5	The dispersive approximation of motions in fractal structures. Some properties of the matter	225
	References (Chapters 13)	232
14.	Extended Fractal Hydrodynamic Model with an Arbitrary Fractal Dimension and its Implications	235
14.1	Introduction	235
14.2	Fractal hydrodynamic model for an arbitrary constant fractal dimension	238
14.3	Particle in a box in a fractal space-time	243
14.4	Harmonic oscillator in a fractal space-time	245
14.5	Free particle in the fractal space-time	249
14.6	Fractal conservation laws	258
14.7	Conclusions	263
	References (Chapters 14)	265
15.	Theory of Fractional Scale Relativity and Some Applications	269
15.1	Introduction	269
15.2	Basic mathematical tools and ideas	269
15.3	Fractional covariant mechanics induced by modified scale laws	272

15.4	Fractional Schrödinger equation and emergence of complex gravity	274
15.5	Scale relativity with fractional derivative for an arbitrary fractal dimension	276
	References (Chapters 15)	279
