Asymptotic Analysis *of* Differential Equations

Preface

The material for this book has resulted from teaching a graduate course in ordinary differential equations at Princeton for several years. Methods of asymptotic analysis including dominant balance, the use of divergent asymptotic series, phase integral methods, asymptotic evaluation of integrals, and boundary layer analysis are covered. The construction of integral solutions and the use of analytic continuation are used in conjunction with the asymptotic analysis, to show the interrelatedness of these methods. Some of the functions of classical analysis are used as examples, to provide an introduction to their analytic and asymptotic properties, and to give derivations of some of the important identities satisfied by them, since it is my experience that students are insufficiently familiar with Whittaker and Watson. There is no attempt to give a complete presentation of all these functions. The emphasis is on the various techniques of analysis; obtaining asymptotic limits, connecting different asymptotic solutions, and obtaining integral representations. Less attention is paid to strict mathematical rigor. A sufficient number of different examples are chosen to demonstrate the various techniques and approaches. Prerequisite material consists of elementary calculus and a basic knowledge of the theory of functions of a complex variable.

In Chapters 1–9 the material in each chapter depends on the results obtained in the previous chapters. These Chapters cover the use of dominant balance for solving equations with a small parameter, a review of the techniques for obtaining exact solutions of soluble differential equations, complex variable theory and analytic continuation, classification of singular points of differential equations and the construction of local expansions to solutions, including nonconvergent asymptotic expansions, phase integral methods, perturbation theory, asymptotic evaluation of integrals,

basic properties of the Euler gamma function, and methods for finding integral solutions of differential equations. Some basic results concerning the gamma function are in fact used in earlier Chapters, so some parts of this chapter should be previewed when necessary. Most of the relations proved concerning $\Gamma(z)$ however depend on results in Chapters 1–7, so it was impractical to move it to an earlier point in the book. Some of the material in the first chapters may be already known, in which case it can be quickly reviewed or skipped.

The remaining Chapters are independent of one another, depending only on the material in the first nine, and can be covered depending on personal interest. All Chapters cannot be covered in one semester, and I normally choose Chapters 11, 12, 16, and 17 after the first nine. Chapter 10 introduces the theory of expansions in series of orthogonal polynomials and derives some of their properties, and also introduces the theory of wavelets. Chapter 11 gives the theory of the Airy function, an understanding of which is essential for a good grasp of the WKB treatment of scattering and bound state problems. Chapter 12 further illustrates the use of integral representations and analytic continuation through an examination of the Bessel function. Chapter 13 does the same for the parabolic cylinder function, and Chapter 14 for the Whittaker function. Chapter 15 examines inhomogeneous equations, some arising from the theory of resistive reconnection of a magnetized plasma, and further explores the role of causality using the Green's function technique for the examination of the equations for a parametric instability. Chapter 16 on the Riemann zeta function provides a brief introduction to the distribution of prime numbers. Chapter 17 treats differential equations containing a small parameter giving rise to boundary layers.

Acknowledgment

The development of this text is the outcome of interactions with many students and research colleagues over many years. Some of the material presented here is also present in other texts which treat asymptotic methods. Normally not covered are the use of Kruskal–Newton graphs, the derivation of Heading’s rules for analytic continuation of phase integral solutions, the associated derivation of the Stokes constants, and the methods for obtaining integral solutions. These approaches have been integrated to show how they are interrelated.

The book was written using Latex, by Leslie Lamport (Addison Wesley, 1994). The figures were made using Super Mongo, written by Robert Lupton, Princeton University (rhl@astro.princeton.edu), and Patricia Monger (monger@mcmaster.ca). I am grateful to Bedros Afeyan for discussions concerning wavelets, Greg Rewoldt for help with Latex, Leonid Zakharov for help with computing, and to Tim Stoltzfus-Dueck for proofreading several chapters.

Finally, I am grateful to my wife Laura and my daughter Veronica for their patience and support during my many years of teaching and research, and to my brother Bob for encouragement and stimulation.

Contents

<i>Preface</i>	v
<i>Acknowledgment</i>	vii
<i>List of Figures</i>	xv
1. Dominant Balance	1
1.1 Introduction	2
1.2 Solutions Using Kruskal–Newton Graphs	3
1.2.1 Third order	3
1.2.2 Non polynomial form	5
1.2.3 Higher order	7
1.2.4 Hidden points	8
1.3 Problems	9
2. Exact Solutions	11
2.1 Introduction	11
2.2 Constant Coefficients	13
2.3 Inhomogeneous Linear Equations	14
2.4 The Fredholm Alternative	16
2.5 The Diffusion Equation	18
2.6 Exact Solutions to Nonlinear Equations	19
2.7 Phase Plane Analysis	19
2.8 Problems	22
3. Complex Variables	25
3.1 Analyticity	25
3.2 Cauchy Integral Theorem	26
3.3 Series Representation	28
3.4 The Residue Theorem	29

3.5	Analytic Continuation	31
3.6	Inverse Functions	32
3.7	Problems	34
4.	Local Approximate Solutions	37
4.1	Introduction	37
4.2	Classification	38
	4.2.1 Ordinary point	39
	4.2.2 Regular singular point	39
	4.2.3 Irregular singular point	42
4.3	Asymptotic Series	45
	4.3.1 Properties	46
	4.3.2 Truncation: A series about $x = 0$	48
	4.3.3 Truncation: A series about $x = \infty$	50
	4.3.4 Truncation: A series about $x = 0$	51
	4.3.5 Asymptotic oscillation	55
4.4	Construction of Asymptotic Series	55
	4.4.1 The error function	56
4.5	Origin of the Divergence	58
4.6	Improving Series Convergence	60
	4.6.1 Shanks transformation	60
	4.6.2 Euler summation	61
	4.6.3 Borel summation	62
4.7	Problems	62
5.	Phase Integral Methods	67
5.1	Introduction	67
5.2	Connection Formulae: Isolated Zero	71
5.3	Derivation of Stokes Constants	73
5.4	Rules for Continuation	76
5.5	Causality	77
5.6	Bound States and Instabilities	78
5.7	Scattering	81
5.8	Eigenvalue Problems	85
5.9	The Budden Problem	86
5.10	The Error Function	88
5.11	Problems	89
6.	Perturbation Theory	91
6.1	Introduction	92
6.2	Eigenvalues of a Hermitian Matrix	93
6.3	Broken Symmetry Due to Tunneling	97

6.4	Problems	100
7.	Asymptotic Evaluation of Integrals	103
7.1	Introduction	103
7.2	End Point	105
7.3	Saddle Point	108
7.4	Problems	112
8.	The Euler Gamma Function	115
8.1	Introduction	116
8.2	The Stirling Approximation	117
8.3	The Euler–Mascheroni Constant	119
8.4	Sine Product Identity	120
8.5	Continuation of $\Gamma(z)$	122
8.6	Asymptotic $\Gamma(z)$	122
8.7	Euler Product for Γ	125
8.8	Integral Representation for $1/\Gamma(z)$	126
8.9	$\Gamma(nx)$	128
8.10	The Euler Beta Function	128
8.11	Problems	129
9.	Integral Solutions	131
9.1	Constructing Integral Solutions	131
9.1.1	Integration by parts	132
9.1.2	Finding a discrete difference equation	134
9.1.3	Construction from a series	135
9.2	Causal Solutions	136
9.3	Comments	138
9.4	Problems	138
10.	Expansion in Basis Functions	141
10.1	Legendre Functions	142
10.1.1	Local analysis	142
10.1.2	Euler integral representation	143
10.1.3	Recurrence relations	145
10.1.4	Laplace integral representation	147
10.1.5	Generating function	149
10.1.6	Legendre polynomials	150
10.2	Orthogonal Polynomials	151
10.3	Wavelets	154
10.3.1	Introduction	154
10.3.2	Scaling function	154
10.3.3	Wavelet basis construction	158

10.3.4 Determining the expansion coefficients	160
10.3.5 Examples	162
10.3.6 Time-frequency analysis	166
10.4 Problems	168
11. Airy	171
11.1 WKB Analysis	172
11.2 Fourier Laplace Integral Representation	174
11.3 Asymptotic Limits	176
11.3.1 Large negative z	176
11.3.2 Large positive z	178
11.3.3 Small $ z $	180
11.4 Mellin Integral Representation	181
11.5 Matching Local Solutions	183
11.6 The Wronskian	185
11.7 Problems	185
12. Bessel	187
12.1 Local Analysis	187
12.1.1 Local at zero	187
12.1.2 Analytic continuation in ν	189
12.1.3 Local at infinity	189
12.2 WKB Analysis	190
12.3 Integral Representations	191
12.3.1 Fourier Laplace representation	191
12.3.2 The Hankel integrals	192
12.3.3 Asymptotic limits	193
12.3.4 Relation to Bessel and Neumann functions	195
12.3.5 The Wronskian	197
12.3.6 Sommerfeld integral representation	198
12.3.7 Mellin integral representation	201
12.4 Generating Function	202
12.5 Matching Local Solutions	202
12.6 Imaginary Argument	203
12.7 Problems	204
13. Weber–Hermite	207
13.1 Local Analysis at Infinity	208
13.2 Local Analysis at Zero	209
13.3 WKB Analysis	210
13.4 Euler Integral Representation	212
13.5 Fourier–Laplace Integral Representation I	213

13.6 Orthogonality	217
13.7 Fourier–Laplace Integral Representation II	218
13.8 The Wronskian	221
13.9 Mellin Integral Representation	222
13.10 Problems	223
14. Whittaker and Watson	225
14.1 Local Analysis at Infinity	226
14.2 Local Analysis at Zero	227
14.3 Euler Integral Representation	227
14.4 Relation Between $M_{\lambda,\mu}(z)$ and $W_{\lambda,\mu}(z)$	230
14.5 Fourier Laplace Integral Representation	231
14.6 Mellin Integral Representation	232
14.7 Special Cases	235
14.7.1 The error function	235
14.7.2 The logarithmic integral function	235
14.8 Problems	235
15. Inhomogeneous Differential Equations	237
15.1 The Driven Oscillator	238
15.2 The Struve Equation	238
15.2.1 Local analysis at zero	239
15.2.2 Local analysis at infinity	239
15.2.3 Integral representation	240
15.3 Resistive Reconnection	240
15.4 Resistive Internal Kink	241
15.5 A Causal Inhomogeneous Problem	242
15.6 Problems	247
16. The Riemann Zeta Function	249
16.1 Introduction	249
16.2 $\zeta(s)$ and $\zeta(1-s)$	251
16.3 The Euler Product for $\zeta(s)$	253
16.4 Distribution of Prime Numbers	254
16.5 Public Key Codes	258
16.6 Stirling Revisited	259
16.7 Problems	262
17. Boundary Layer Problems	263
17.1 Introduction	263
17.2 Layer Location	264
17.3 Layer at Left Boundary	267
17.4 Layer in Domain Center	269

17.5 Layer at Right Boundary	271
17.6 Nested Boundary Layers	272
17.7 Problems	275
Appendix Lagrange's Theorem	277

List of Figures

1.1	Kruskal–Newton Graph.	2
1.2	Kruskal–Newton Graph showing lines of dominant balance.	4
1.3	Convergence of iteration of Eq. 1.4, $\epsilon = 0.3$	5
1.4	Kruskal–Newton Graph showing lines of dominant balance for Eq. 1.8.	6
1.5	Kruskal–Newton Graph showing lines of dominant balance for Eq. 1.11.	7
1.6	Kruskal–Newton Graph with inaccessible points, Eq. 1.15. . .	8
2.1	Phase plot for Eq. 2.46.	21
2.2	Numerical integration of Eq. 2.45.	23
3.1	Analytic continuation of the series $\sum_k z^k$ successively from $z = 0$ to $z = a, b, c$	32
3.2	Analytic continuation of $f = \sqrt{1-z}$	33
4.1	Number of terms kept in optimal asymptotic expansion of Eq. 4.48.	49
4.2	Numerical $y(x)$ and asymptotic approximation to Eq. 4.48. .	49
4.3	Number of terms kept in optimal asymptotic expansion to Eq. 4.53.	52
4.4	Numerical $y(x)$ and asymptotic approximation to Eq. 4.53. .	52
4.5	Magnitude of terms in asymptotic series vs n for Eq. 4.56. .	53
4.6	The number of terms retained in the asymptotic sum, N , and the analytic expression $4/\sqrt{x}$ for Eq. 4.56.	53

4.7	Numerical integration of $W(x)$ for both solutions (smooth), and the optimal asymptotic series approximations (jagged) for Eq. 4.56.	54
4.8	The error function, showing optimal asymptotic expressions, which do not exist for $ x < .7$	57
4.9	Numerical integration of $G(x)$ (smooth), and the optimal asymptotic series approximations (jagged).	59
5.1	Stokes diagram for $Q = (z - z_l)(z - z_2)(z - z_3)^2/(z - z_4)$ with $z_1 = l + i$, $z_2 = -1 - i$, $z_3 = 1 - i$, and $z_4 = -1 + i$	70
5.2	Stokes diagram for a first order turning point.	72
5.3	Large scale Stokes diagram for the Bessel function.	75
5.4	Stokes plot for the bound state problem.	79
5.5	Stokes plot for the overdense barrier.	81
5.6	$Q = z^2$, Stokes plot.	83
5.7	Phase δ for overdense scattering, $Q = z^2 - b^2$	84
5.8	Stokes constant for overdense scattering, $Q = z^2 - b^2$	84
5.9	Stokes diagram during search for eigenvalue.	85
5.10	Stokes diagram for Budden problem.	87
6.1	Eigenvalues of a Hermitian matrix <i>vs</i> perturbation.	96
6.2	Probability of close eigenvalues in a random Hermitian matrix.	96
6.3	Q function for the double potential.	98
6.4	Stokes plot for the double potential.	98
6.5	Even and odd parity solutions.	99
7.1	Integration path for Eq. 7.8.	107
7.2	Integrand for a saddle point of width w	109
7.3	Contours of equal magnitude of $e^{ixt-xt^2/2}$, showing the integration contour and the saddle.	111
8.1	Plot of $\Gamma(x)$	117
8.2	Integration path for evaluation of I	120
8.3	Integration path for continuation of Γ	123
8.4	Integration path for evaluation of Γ , $Rez \rightarrow +\infty$	123
8.5	Integration path for evaluation of Γ , $Rez \rightarrow -\infty$	124
8.6	Integration path for $1/\Gamma$	127
10.1	Integration paths for the Legendre function.	144

10.2	Integration path for the Laplace representation of P_ν	148
10.3	Integration path for the Laplace representation of Q_ν	149
10.4	Nested function spaces, with $V_{k+1} = W_k \bigoplus V_k$	159
10.5	The functions given by the length two filter Eqs. 10.104, 10.105.	162
10.6	A wavelet approximation using the Haar wavelet system with $0 \leq k \leq 4$	163
10.7	A wavelet approximation using the Haar wavelet system with $0 \leq k \leq 8$	164
10.8	Distribution of the wavelet amplitudes for the expansion given in Fig. 10.7.	165
10.9	The functions given by the length four filter Eq. 10.81.	165
10.10	An example of a Malvar-Wilson basis function.	167
11.1	Stokes diagram for the Airy function.	173
11.2	Integration paths for the Airy function.	175
11.3	Integration paths showing saddle points for $\text{Re } z < 0$	176
11.4	Integration paths showing saddle points for $\text{Re } z > 0$	179
11.5	Airy function by matching local expansions.	183
11.6	Optimal number of terms in asymptotic expansions for Airy.	184
12.1	Stokes plot for the Bessel equation.	191
12.2	Integration paths for the Hankel functions.	193
12.3	Deformed integration paths for the Hankel functions.	196
12.4	Sommerfeld contours for the Bessel functions.	199
12.5	Sommerfeld contour for the Bessel function for ν integer.	200
12.6	Local approximations to $J_0(x)$	203
13.1	Stokes diagram for the Parabolic Cylinder function.	210
13.2	Saddle point for large positive z evaluation using the Euler integral representation.	213
13.3	Integration path for a Fourier–Laplace representation of the parabolic cylinder function.	214
13.4	Saddle point for large positive z evaluation of the parabolic cylinder function using the second Fourier–Laplace repre- sentation.	218
13.5	Saddle point for large imaginary z evaluation of the parabolic cylinder function.	219

13.6	Saddle point for large negative z evaluation of the parabolic cylinder function.	220
14.1	Integration path for the Euler representation of the Whittaker function.	229
14.2	Integration path for the Mellin representation of the Whittaker function.	234
15.1	Integration path for $Q > 1/4$	246
15.2	Integration path for $Q < 1/4$	247
16.1	Integration contour for $\zeta(s)$	250
16.2	Contour for integral representation of the zeta function.	252
16.3	Distribution of prime numbers.	255
16.4	Difference between the distribution of primes and the analytic expression.	256
17.1	Layer on the left.	265
17.2	Layer on the right.	266
17.3	Internal layer.	267
17.4	Lowest order uniform solution (red) and numerical integration for Eq. 17.4.	269
17.5	Lowest order uniform solution (red) and numerical integration for Eq. 17.12.	270
17.6	Lowest order uniform solution (red) and numerical integration for Eq. 17.17.	272
