Foreword

The year 1979 is the one-hundredth anniversary of Albert Einstein's birth. The International Society for General Relativity and Gravitation, which has yet to celebrate the tenth anniversary of its birth, has decided to mark the Einstein Centenary by offering to the community of scientists this collection of articles.

Albert Einstein was a towering personality in theoretical physics. The general theory of relativity was perhaps his greatest achievement, and it is certainly the one that most people associate with his name. Einstein also was a philosopher and a social activist who hated passionately war and every form of violence. Our organization was founded as an international society because the modest number of relativists throughout the world made a single organization the most rational way for promoting our common aims, as well as to emphasize the international nature of the search for scientific knowledge and, by our common efforts, perhaps to make some small contribution toward the cooperation and friendship of all peoples. We believe that we are acting in the spirit of the man whom we are honoring by dedicating these volumes to his memory.

Peter G. Bergmann
President

Preface

Together with the decision to produce these volumes came the realization that one cannot hope to cover adequately all of the significant activities in general relativity even in two books devoted primarily to review articles. Quantitatively the research now covers too wide a front for that; qualitatively no one individual, even when writing on a specific topic, can hope to do justice to all the different attitudes toward the subject that exist within the community of relativists. The editors of these volumes have tried to present books that represent a good number of the facets of the field and to some extent we feel that we have succeeded although there do remain obvious gaps.

Without doubt the problem considered most pressing by the majority of today's relativists is the apparent incompatibility between the two major physical theories of the twentieth century, namely relativity and quantum theory. As a reflection of this concern these books offer a number of articles dealing with quantization and general relativity. Within this field there are several approaches. The oldest of these uses the canonical approach to relativity, a topic to which a large portion of Volume 1 is devoted. In addition to the article on quantization, other problems that are discussed using this formalism are the Cauchy problem, the positive mass conjecture, and the Hamiltonian structure of space-time. The necessary background is covered in an extensive review article.

Volume 1 also contains several articles expounding the gauge theory and the supergravity outlook. The more exotic approach through the use of twistors is described in Volume 2.

In recent years much work has also been devoted to the question, "What is the effect of a curved space-time on the quantum theory as we know it?" Investigations of this question have led to the discovery of such effects as black hole evaporation and to possible explanations of processes prevalent in the initial stages of the universe, thus providing further impetus for its study. We provide an introductory article to the subject in Volume 1.

Since the early 1960s, when conformal structures were introduced into the study of asymptotic properties, a number of important related themes

have been studied. These studies form the basis of the first part of Volume 2, beginning with analyses of null and spatial infinities (as explained in three different articles). These investigations lead naturally to the use of complexified space-times as a mathematical device. How this is done is explained in an article on complex variables in relativity. The application of complex variables to \mathfrak{N} and $\mathfrak{N}\mathfrak{N}$ spaces is given in a further article.

Also dating from the sixties is the interest in singularities, whether and how they arise, together with their classification. Volume 2 contains a major review of this aspect of relativity theory.

Among the more important recent developments have been the astounding improvements in modern computers. It is no longer a question of computers merely being used for numerical integrations. They can now be applied constructively to the more elegant aspects of relativity. Details appear in an article which relates what has been done, explains different computing systems, and gives an intriguing hint of the future.

No survey of the fields would be complete without some review of the less spectacular but nonetheless necessary background mathematical work which still goes on and forms a necessary part of the repertoire of every relativist. To this end Volume 1 contains articles on fiber bundles, the problem of embedding, the separability of the Hamilton–Jacobi equation, conserved quantities, and the method of two-timing.

In this maze of beautiful mathematics and theories, one must not lose sight of the fact that Einstein, like every good physicist, was concerned primarily with the real world. Our work regains contact with the cosmos in Volume 2 with articles on cosmology and on gravitational collapse. Finally it comes down to earth in the form of discussions on the detection of gravitational waves, experimental tests of relativity, and statistical mechanics.

Included in Volume 1 are two articles with an historical flavor. Insight into the development of the general theory is given by the first, which traces the interaction between Einstein and the rotating disk. The second reports on Einstein's contribution to the theory of the laser. Who knows, perhaps if the technology had been available . . .

We hope that this two-volume work will serve as a quasi-textbook with something in it of benefit to the student launching his studies in this perhaps most fascinating field of modern physics as well as to the experienced researcher, who might just obtain from it a spark of inspiration to lead him in a new direction.

The Editors

Contents of Volume 1

1. Einstein and the Rigidly Rotating Disk
John Stachel
2. Einstein's Photon Distribution for Blackbodies and the Discovery of the Laser
Heinrich Hora
3. Canonical Gravity
James Isenberg and James Nester
4. The Cauchy Problem
Yvonne Choquet-Bruhat and James W. York, Jr.
5. The Positive Mass Conjecture
Dieter R. Brill and Pong Soo Jang
6. The Hamiltonian Structure of Space-Time
Claudio Teitelboim
7. The Phase Space Formulation of General Relativity and Approaches Toward Its Canonical Quantization
Peter G. Bergmann and Arthur Komar
8. Quantum Fields in Curved Space
P. C. W. Davies
9. Fiber Bundles, Gauge Fields, and Gravitation
Andrzej Trautman
10. Gravity, Groups, and Gauges
Yuval Ne'eman
11. Gravitation and the Poincaré Gauge Field Theory with Quadratic Lagrangian
Friedrich W. Hehl, Jürgen Nitsch, and Paul Von der Heyde
12. From Gravity to Supergravity
S. Deser

13. The Theory of Separability of the Hamilton–Jacobi Equation and Its Applications to General Relativity
Sergio Benenti and Mauro Francaviglia
14. Local Isometric Embedding of Riemannian Manifolds and Einstein’s Theory of Gravitation
Hubert F. Goenner
15. Invariant Transformations, Conservation Laws, and Energy–Momentum
Joshua N. Goldberg
16. A Review of Algebraic Computing in General Relativity
R. A. d’Inverno
17. High-Frequency Gravitational Waves, Two-Timing, and Averaged Lagrangians
A. H. Taub
18. Supergravity: An Odyssey through Space–Time and Superspace
S. Ferrara and P. van Nieuwenhuizen

Contents

1. Asymptotically Flat Space–Times

E. T. Newman and K. P. Tod

1. Introduction	1
2. The Definition of Asymptotic Flatness and the NU Tetrad	4
2.1. The Definition of \mathcal{I}	4
2.2. The Coordinate and Tetrad System	5
3. The Spin Coefficient Formalism	9
4. Asymptotic Solutions of the Spin Coefficient Equations	13
5. The Bondi–Metzner–Sachs Group	17
6. Applications of the Formalism	20
6.1. Exact Solutions	20
6.2. Perturbation Calculations	21
6.3. Cone Space and \mathcal{H} Space	21
Appendix A: The Spin Coefficients Equations	24
A.1. The Einstein–Maxwell Equations	24
A.2. The Einstein–Yang–Mills Equations	27
Appendix B: Solutions	29
B.1. Asymptotically Flat Einstein–Maxwell Fields	29
B.2. The Robinson–Trautman Solutions	31
B.3. Twisting Algebraically Special Solutions	32
References	34

2. Asymptotic Structure of the Gravitational Field at Spatial Infinity

Abhay Ashtekar

1. Introduction	37
2. Minkowski Space–Time	40
2.1. Isometries	40
2.2. Physical Fields: An Example	42
2.3. Physical Fields: General Structure	43
3. The Basic Definitions	46
3.1. Preliminaries	46
3.2. Asymptotic Conditions	47
4. Asymptotic Symmetries	50
5. Asymptotic Fields	54
6. Conserved Quantities	57
6.1. The ADM 4-Momentum	58
6.2. The Angular Momentum	59

7. Other Approaches	61
7.1. Geroch's Version of the ADM Approach	62
7.2. The Sommers Approach	63
8. Discussion	65
<i>Appendix: Open Issues and Possible Extensions</i>	67
<i>References</i>	68

3. Angular Momentum in General Relativity

Jeffrey Winicour

1. Introduction	71
2. Angular Momentum of Asymptotically Flat Space-Times	72
2.1. Null Infinity	74
2.2. Spatial Infinity	77
3. Radiative Complications	80
4. Sources	84
4.1. Kinematic Preliminaries	85
4.2. Exact Exteriors	86
4.3. Exact Interiors	87
4.4. Global Solutions	88
4.5. General Features	90
5. Conclusion	93
<i>References</i>	93

4. Singularities and Horizons—A Review Article

F. J. Tipler, C. J. S. Clarke, and G. F. R. Ellis

1. Introduction	97
2. The Early Work on Singularities	98
3. Beginnings of a New Approach	111
3.1. Timelike and Null Curves	112
3.2. Causal Relations	116
3.3. Technical Advances	123
4. The Existence and Nature of Singularities	129
4.1. The Occurrence of Singularities	131
4.2. The Definition of Singularities	139
4.3. The Nature of Singular Space-Times	141
5. The Study of Singularities since 1970	147
5.1. Weakening the Conditions of the Classical Theorems	147
5.2. The Definition of Boundary Structure	152
5.3. Types of Singularity	155
5.4. The Nature of Physical Singularities	162
6. Unsolved Problems	167
6.1. Strong Cosmic Censorship	167
6.2. Weak Cosmic Censorship	176
6.3. Quantum Mechanics and Singularities	189
<i>References</i>	190

5. Complex Variables in Relativity

Edward J. Flaherty, Jr.

1. Introduction	207
2. Complex Substitutions	207
3. Null Tetrads and the Schwarzschild-to-Kerr Transformation	211
4. Mathematical Digression	221
5. Holomorphic Functions and H -Spaces	227
6. Conclusion	236
References	237

6. Complex General Relativity, \mathfrak{H} and $\mathfrak{H}\mathfrak{H}$ Spaces—A Survey of One Approach

C. P. Boyer, J. D. Finley, III, and J. F. Plebański

1. Introduction	241
2. Preliminaries	244
3. Basic Properties of \mathfrak{H} Spaces	250
4. Explicit Solutions and Symmetries of \mathfrak{H} Spaces	254
4.1. Explicit Examples of \mathfrak{H} Spaces	254
4.2. Symmetries of \mathfrak{H} Spaces	258
4.3. Further Comments on \mathfrak{H} Spaces	262
5. Null String Foliations and $\mathfrak{H}\mathfrak{H}$ Spaces	263
5.1. The Geometry of Null Foliations	264
5.2. Nonexpanding $\mathfrak{H}\mathfrak{H}$ Spaces	267
5.3. Expanding $\mathfrak{H}\mathfrak{H}$ Spaces	270
5.4. $\mathfrak{H}\mathfrak{H}$ Spaces with Two Sets of Null Strings	274
6. Further Properties of $\mathfrak{H}\mathfrak{H}$ Spaces	275
6.1. Explicit Solutions for $\mathfrak{H}\mathfrak{H}$ Spaces	275
6.2. Symmetries in Nonexpanding $\mathfrak{H}\mathfrak{H}$ Spaces	277
6.3. Electrovac $\mathfrak{H}\mathfrak{H}$ Spaces	278
7. Conclusions and Further Comments	278
References	279

7. Twistors for Flat and Curved Space–Time

R. Penrose and R. S. Ward

1. Introduction	283
2. Twistor Theory in Flat Space–Time	284
2.1. Twistor Algebra and Geometry	284
2.2. Massless Free Fields	298
3. Twistors in Curved Space–Time	308
4. The Nonlinear Gravitation Construction	311
4.1. Half-Flat Spaces and Curved Twistor Space	311
4.2. Examples	315
4.3. Massless Fields on a Half-Flat Background	318
5. Hypersurface Twistors	321
5.1. CR Structure and Hypersurface Twistors	321
5.2. Twistors Relative to a Null Hypersurface	322
References	328

8. Cosmology

E. P. T. Liang and R. K. Sachs

1. Einstein and the Universe	329
1.1. Introduction	329
1.2. Historical Comments	330
2. Spatially Homogeneous, Isotropic Cosmological Models	332
2.1. Pressure Zero Newtonian Models	332
2.2. Is the Universe Open or Closed?	335
2.3. $k = 0$ Relativistic Models	337
2.4. The Standard Hot Big Bang Model	340
3. Some Recent Developments	342
3.1. The Distribution of Galaxies	342
3.2. Gravitational Instability	345
3.3. The Distribution of Radio Sources, QSO's, and Intergalactic Matter	347
3.4. The Microwave Background	348
3.5. Nucleosynthesis in the Early Universe	351
4. Some Current Problems	353
<i>References</i>	355

9. Gravitational Collapse to the Black Hole State

J. C. Miller and D. W. Sciama

1. Introduction	359
2. Black Hole Formation by Gravitational Collapse of Ordinary Stars	360
3. Spherical Collapse	365
4. Nonspherical Collapse	376
5. Collapse of Rotating Configurations	379
6. Gravitational Radiation from Gravitational Collapse	385
7. Conclusion	388
<i>References</i>	388

10. Gravitational Waves and Their Interaction with Matter and Fields

L. P. Grishchuk and A. G. Polnarev

1. Introduction	393
2. Test Particles and Photons in the Field of a Gravitational Wave	395
2.1. Description of the Motion of a Free Particle in a Locally Inertial Frame	395
2.2. Systematic Change of Energy and the Mean Trajectory of a Moving Particle	399
3. Detection of Gravitational Waves	402
3.1. Mechanical Oscillator	403
3.2. Quantum Theory of Mechanical Oscillator	406
3.3. Electromagnetic Detectors of Gravitational Waves	409
3.4. Rotating Two-Body Systems as Detectors of Gravitational Waves	413
4. The Interaction of Gravitational Waves with Electromagnetic Field, Matter, and Curvature	416
4.1. Mutual Conversion of Gravitational and Electromagnetic Waves	417
4.2. Interaction of Gravitational Waves with Matter	419
4.3. Interaction of Gravitational Waves with Background Curvature	427
<i>References</i>	430

11. The Search for Gravitational Radiation

J. Weber

1. Introduction	435
2. Interaction of a Gravitational Wave with Coupled Masses	436
3. Interaction of an Elastic Solid with Gravitational Waves	441
4. The Free-Mass Gravitational Radiation Antenna	442
5. Comparison of an Elastic Solid with Direct Method of Measuring Curvature ...	443
6. Instrumentation of an Elastic Solid Gravitational Radiation Antenna	443
7. Piezoelectric Crystal Instrumentation	444
8. Antenna Directivity Pattern	446
9. Sensitivity of a Gravitational Radiation Antenna	447
10. Fluctuations	448
11. Short-Pulse Algorithm	449
12. Antenna Coupling and Quality Factor	452
13. Early Search for Gravitational Radiation at Kilohertz Frequencies	452
14. Errors, Correction of Errors, Controversy, and Computer Results	456
15. Summary of the 1973–1974 Maryland–Argonne Observations	458
16. Sensitivity Measurements and Calibration	460
17. Development of Maryland Low-Temperature Gravitational Radiation Antennas	461
18. Normal Modes of the Earth and the Moon	461
19. Comments on the Observations	462
20. Electronics Noise Temperature, Quantum Limitations, and Long-Term Outlook .	463
<i>References</i>	465

12. Experimental Tests of the General Theory of Relativity

Irwin I. Shapiro

1. Introduction	469
2. Principle of Equivalence for Massive Bodies	469
3. Clock Comparisons	472
4. Light Deflection	474
5. Signal Retardation	477
