PREFACE

The *American Drug Index* has been prepared for the identification and correlation of the many pharmaceuticals available to the medical and allied professions. The need for this index has become acute as the number of drugs and drug products in all their tremendous variety has multiplied.

The organization of the index is fundamentally alphabetical with extensive cross-indexing. Names listed are generic; brand (trade-mark, proprietary or specialty), chemical, U.S.P., N.F., N.N.D. and A.D.R. Synonyms that are in general use also are included. All names used for a pharmaceutical occur in alphabetical order with the pertinent data given under the brand name and the name by which it is made available. Data included are generic names, chemical names, manufacturer, pharmaceutical forms, size, dosage and use. Generic names occur in alphabetical order and here the recognition of the drug is indicated by U.S.P. (United States Pharmacopeia), N.F. (National Formulary), N.N.D. (New and Nonofficial Drugs) and A.D.R. (Accepted Dental Remedies). The information is in accord with the latest editions of these books: U.S.P. XVI, N.F. XI, N.N.D. 1960, A.D.R. 1960.

Because of the multiplicity of specialty names (brand names) used for the same therapeutic agent or the same combination of therapeutic agents, it was apparent that some correlation could be done. As an example of this, please turn to Aluminum Hydroxide Gel. Here under the generic name are given the brand names. Following are combinations of aluminum hydroxide gel organized in a manner to point out relationships among the many products. Reference then is made to the specialty name or names having the indicated composition. Under the specialty name are given manufacturer, composition, available forms, sizes, dosage and use.

The multiplicity of generic names for the same therapeutic agent has complicated the nomenclature of these agents. Examples of multiple generic names for the same chemical substance are (1) parabromdylamine, brompheniramine; (2) acetaminophen, p-hydroxy acetanilid, N-acetyl-p-aminophenol; (3) d-isoephedrine, d-pseudoephedrine; (4) methapyrilene HCl, thenylpyramine HCl; and (5) pyrilamine, pyranisamine, pyranilamine, pyraminyl and anisopyradamine.

The *American Drug Index* should be most useful to physicians, pharmacists, dentists, nurses, and to sales personnel, students and teachers in the fields incorporating pharmaceuticals. The cross-indexing feature permits the finding of drugs or drug combinations when only one major ingredient is

known. For example, a combination of aluminum hydroxide gel and magnesium trisilicate is available. This combination can be found by looking under the name of either of the two ingredients, and in each case the specialty names are given.
