Preface

After completing my dissertation in differential geometry, I returned to Maharishi University of Management to join the faculty there. The greatest need for my services was in the physics department, and the chairman, the well-known John Hagelin, pointed the finger of authority and said 'quantum field theory!' The class was to start in a few weeks. I laughed, but John was serious.

Fortunately, I had audited Sidney Coleman's outstanding Harvard lectures and had taken very good notes. Equally fortunate, I had Robert Brandenburger's official solutions to all the homework sets. I rolled up my sleeves and waded in.

As we battled through the material, the beautiful architecture of Coleman's course became apparent. It introduced the primary concepts – canonical quantization, renormalization, spin, functional integral quantization – one at a time and made each one practical before advancing to the next abstraction. It started with simple models and provided motivation for each elaboration.

The students, however, pinned me to the board with questions about every step in the logic. Could I produce some mathematics to fill the gap? Was there a physical principle which would justify the proposed step? The standard references failed to meet the need, and for the most part I was stumped. It was a couple of years later, when the next group of graduate students was ripening, that I found time to think out some answers. The result was a draft of the first nine chapters of this book.

Student feedback was most helpful for refining this draft, and as I began to take on the teaching of more advanced material and continued to work with successive classes, the notes developed into a pretty good book.

As this history indicates, this book is unique. The common approach in other texts is generally either that of a model builder who aims at efficient presentation of what works, or that of an applied mathematician who is trying to find a foundation for the techniques of the practicing field theorist. The model builder tends to treat technical mountains as molehills and conserves energy by omitting the details of every derivation. The applied mathematician gets absorbed in the technical mountains and does not get close to presenting anything practical. My work is half way between these two. If I may be permitted a Fullerian sentence, my text aims to provide the usual practical knowledge of QFT in comfortable stages naturally structured by the systematic introduction of fundamental principles, pleasantly enriched with overviews, summaries, and delightful mathematical details.

It has been a pleasure to work with Coleman's notes, with the many students who took my classes, and with Blue Sky Research's implementation of TEX. I would particularly like to thank Kurt Kleinschnitz for excellent suggestions, Sunil Rawal for help with the closing chapters, Geoff Golner for explaining Wilson's exact renormalization group, John Hagelin for pushing me off the deep end, and Maharishi University of Management for the financial support that made this work possible.

This book is a great satisfaction to me, and I would like to thank Cambridge University Press for making it possible to share this satisfaction with others. I hope it will be a useful reference for physics students with questions in this area and an intelligible introduction for mathematicians who are trying to find out what the physicists are up to.

Robin Ticciati
Maharishi University of Management

Introduction

This text provides a mathematical account of the principles and applied techniques of quantum field theory. It starts with the need to combine special relativity and quantum mechanics, and culminates in a basic understanding of the Standard Model of electroweak and strong interactions. The exposition is enriched with as much mathematical detail as is useful for developing a practical knowledge of quantum field theory. All the details can be brought out in a three semester course, and the main ideas can comfortably occupy two semesters. The prerequisites for this presentation are (1) familiarity with the Hilbert-space formalism of quantum mechanics, (2) assimilation of the basic principles of special relativity, and (3) a goodly measure of mathematical maturity.

The book is divided into five parts. These cover (1) canonical quantization of scalar fields, (2) Weyl, Dirac, and vector fields, (3) functional integral quantization, (4) the Standard Model of the electroweak and strong interactions, and (5) renormalization. Each of the five parts introduces one primary new principle and, having developed that principle to a goodly degree of practicality, naturally motivates its own extension in the next part.

Part 1, Chapters 1–5, presents the principles that transform quantum mechanics and special relativity into canonical perturbative quantum field theory. Its goal is to arrive at cross sections with minimal technical machinery. Part 2, Chapters 6–9, provides fields for realistic models like QED. It covers representation theory of the Lorentz group and extends the principles of Part 1 to Weyl spinors, Dirac spinors, and massive vector fields. At the end of Part 2, three weaknesses of perturbative canonical quantization are apparent, namely, its application to unstable particles, derivative interactions, and gauge theories. This motivates Part 3, Chapters 10–13, in which Haag–Ruelle scattering theory, renormalization, and functional integral quantization are developed. Using this new formalism, Part 4, Chapters 14–17, presents the structure of the Standard Model, introduces hadrons, and provides tree-level applications of the Standard Model. Finally, having taken tree-level theory about as far as is useful, Part 5 goes more deeply into regularization, renormalization, renormalizability, and the renormalization group.

The principles, examples, and techniques presented in this text are, for the most part, quite standard. However, the detailed treatment of the representation theory of the Lorentz group and $SU(3)$ in Chapters 6 and 14 respectively is unusual and helps to make this text self-sufficient. The use in Chapter 7 of Weyl spinor fields as an aid to deriving Feynman rules for Fermi fields is also unusual. The two-component spinor notation built up in that chapter is more commonly used in superfield theory.

Internal references are written without parentheses in the form '12.3.6' rather than '(12.3.6)'. To save the reader from looking up references unnecessarily, references are qualified by descriptive phrases rather than by an unhelpful noun. For example, we write 'the winding-number formula 13.7.11' rather then 'Theorem 13.7.11'.

Contents

Preface xiii
Introduction xv

1. Relativistic Quantum Mechanics 1
1.0 Introduction 1
1.1 One-Particle State Space – Mathematics 2
1.2 One-Particle State Space – Physics 4
1.3 The Action of Translations on States 5
1.4 The Action of the Lorentz Group on States 6
1.5 Representing the Poincaré Group 8
1.6 The Position Operator 9
1.7 Summary 12

2. Fock Space, the Scalar Field, and Canonical Quantization . . . 13
2.0 Introduction 13
2.1 Bosonic Fock Space 13
2.2 Harmonic Oscillator Review 15
2.3 Application to Fock Space 16
2.4 The Free Scalar Field 17
2.5 Canonical Quantization of Classical Mechanics 22
2.6 Canonical Quantization of Classical Fields 25
2.7 The Structure of the Vacuum State 30
2.8 Summary 35

3. Symmetries and Conservation Laws 36
3.0 Introduction 36
3.1 Four Levels of Symmetry in an Example 37
3.2 Symmetry and Conserved Quantities in Classical Mechanics . . 40
3.3 Symmetry and Conserved Quantities in Quantum Mechanics . . 43
3.4 Symmetry and Conservation Laws in Classical Field Theory . . 45
3.5 Application: Complex Quantum Fields 48
3.6 Groups of Matrices and their Lie Algebras 54
3.7 Internal Symmetries in Quantum Field Theory 57
3.8 The Actions and Algebra of Conserved Quantities 60
3.9 Translation Symmetry 64
3.10 Lorentz Symmetry 65
3.11 Application: Quantum Numbers 67
3.12 Charge Conjugation 70
3.13 Parity 72
3.14 Time Reversal 74
3.15 Summary 78

4. From Dyson's Formula to Feynman Rules 79
4.0 Introduction 79
4.1 The Interaction Picture and Dyson's Formula 80
4.2 The Wick Expansion of the Scattering Matrix 85
4.3 Wick Diagrams 87
4.4 The Combinatorics of Wick Diagrams 91
4.5 Reduction to Connected Wick Diagrams 93
4.6 First Example: A Time-Dependent Classical Source 95
4.7 Second Example: A Time-Independent Classical Source 97
4.8 Comparison with Classical Field Theory 101
4.9 Feynman Diagrams and Feynman Rules 103
4.10 Third Example: Tree-Level Scattering 108
4.11 Lorentz Invariance and Elimination of Variables 111
4.12 Crossing and Mandelstam Parameters 114
4.13 Preliminary Points on Renormalization 116
4.14 Summary 120

5. Differential Transition Probabilities and Predictions 121
5.0 Introduction 121
5.1 Differential Transition Probabilities 121
5.2 The Invariant Density for Two-Particle Final States 124
5.3 The Invariant Density for Three-Particle Final States 126
5.4 Decays 128
5.5 Cross Sections 129
5.6 The Optical Theorem 132
5.7 Summary 135

6. Representations of the Lorentz Group 136
6.0 Introduction 136
6.1 From Lie Group to Lie Algebra Representations 137
6.2 Definitions for Representation Theory 141
6.3 Detailed Structure of $su(2)$ and $so(1,3)$ 147
6.4 $su(2)$ in Particular 150
6.5 The Tensor Product 154
6.6 Weights and Tensor Products 155
6.7 The Representations of $so(1,3)$ 159
6.8 Tensor Products of $so(1,3)$ Representations 161
6.9 Complex Conjugation, Parity, and Restriction to Rotations . 161
6.10 Vectors, Tensors, and Symmetry 163
6.11 Summary 165

7. Two-Component Spinor Fields 166
7.0 Introduction 166

7.1 The Lorentz Group Action on Spinors . . . 167
7.2 The Lorentz Group and $SL(2, \mathbf{C})$ . . . 168
7.3 Invariant Terms from Spinors and Vectors . . . 170
7.4 Fermionic Calculus . . . 171
7.5 Classical Massless Weyl Spinors . . . 173
7.6 Free Massless Weyl Quantum Fields . . . 177
7.7 Conserved Current and Quantity . . . 180
7.8 Helicity . . . 181
7.9 Angular Momentum of a Free Spinor . . . 183
7.10 Contractions for Massless Weyl Spinors . . . 186
7.11 Defining an Example . . . 188
7.12 – First Application . . . 189
7.13 – Second Application . . . 192
7.14 – Third Application . . . 194
7.15 – Conclusion of Example . . . 196
7.16 Two-Component Spinor Notation . . . 198
7.17 Massive Weyl Spinors . . . 200
7.18 – Equations of Motion, and Dirac Algebra . . . 204
7.19 Summary . . . 206

8. Four-Component Spinor Fields . . . 207
8.0 Introduction . . . 207
8.1 Representations of the Dirac Algebra . . . 207
8.2 Basic Features of Dirac Algebra . . . 210
8.3 Polarization Spinors in the Standard Representation . . . 212
8.4 Canonical Quantization of Dirac Spinors . . . 215
8.5 Feynman Rules for Dirac Spinors . . . 217
8.6 Dirac Algebra . . . 222
8.7 Fierz Transformations . . . 224
8.8 Dirac Spinor Scattering Example . . . 227
8.9 Charge Conjugation . . . 230
8.10 Parity . . . 233
8.11 Time Reversal . . . 236
8.12 The Action of Discrete Symmetries on Bilinear Terms . . . 239
8.13 Combinations of C, P, and T . . . 241
8.14 Summary . . . 244

9. Vector Fields and Gauge Invariance . . . 246
9.0 Introduction . . . 246
9.1 The Lagrangian Density and Plane Wave Solutions . . . 247
9.2 Quantization of the Massive Vector Field . . . 250
9.3 Feynman Rules for the Massive Vector Field . . . 253
9.4 The Massless Limit of the Massive Theory . . . 257

9.5 Compton Scattering . . . 259
9.6 The Gauge Principle . . . 262
9.7 Gauge Invariance and Minimal Coupling . . . 265
9.8 Mass Term and Current Conservation . . . 266
9.9 Discrete Symmetries . . . 267
9.10 Summary . . . 268

10. Reformulating Scattering Theory . . . 269
10.0 Introduction . . . 269
10.1 Generating Functionals and Green Functions . . . 270
10.2 The Generating Functional in Perturbation Theory . . . 272
10.3 Green Functions and Feynman Diagrams . . . 274
10.4 In and Out States . . . 277
10.5 The LSZ Reduction Formula for Scattering Amplitudes . . . 281
10.6 Change in Notation . . . 285
10.7 Computation with Bare Fields and Parameters . . . 286
10.8 Computing with Renormalized Fields and Parameters . . . 287
10.9 1PI Green Functions and Counterterm Renormalization . . . 291
10.10 Example: Field and Mass Renormalization Conditions . . . 295
10.11 Example: Coupling Renormalization Condition . . . 299
10.12 Extending the Formalism to Dirac Fields . . . 301
10.13 Dirac Renormalization Conditions . . . 306
10.14 Extending the Formalism to Vector Fields . . . 309
10.15 Lehmann–Källén Spectral Representation . . . 313
10.16 Extending the Formalism to Unstable Particles . . . 317
10.17 Modeling Unstable Particles . . . 319
10.18 Propagation of Unstable Particles . . . 324
10.19 Summary . . . 326

11. Functional Integral Quantization . . . 328
11.0 Introduction . . . 328
11.1 Deriving the Functional Integral from Quantum Mechanics . . . 329
11.2 An Example: the Free Particle . . . 332
11.3 Details of Functional Integration: Operator Ordering . . . 335
11.4 – Wick Rotation of Time . . . 338
11.5 – Evaluating Gaussians . . . 339
11.6 Fourier Transform of Inner Products and Operators . . . 343
11.7 Functional Integral Quantization: Lagrangian Form . . . 346
11.8 – Perturbation Expansion . . . 351
11.9 – Hamiltonian Form . . . 356
11.10 Extension to the Free Massive Vector Field . . . 359
11.11 Fermionic Functional Differentiation . . . 361
11.12 Functional Derivative Quantization for Fermions . . . 367

11.13 Summary 370

12. Quantization of Gauge Theories 372
12.0 Introduction 372
12.1 Massive Spinor QED 372
12.2 Massive Scalar QED 375
12.3 Outline of Faddeev–Popov Quantization of Gauge Theories . 376
12.4 QED in Covariant Gauge 381
12.5 The Geometry of Gauge Field Theories 384
12.6 Classical Minimally-Coupled Gauge Theories 390
12.7 Quantization of Non-Abelian Gauge Theories 393
12.8 Global and Local Spontaneous Symmetry Breaking 398
12.9 Goldstone's Theorem and the Higgs Mechanism 401
12.10 Quantization after Spontaneous Symmetry Breaking 404
12.11 Faddeev–Popov Quantization Revisited 407
12.12 Summary 410

13. Anomalies and Vacua in Gauge Theories 412
13.0 Introduction 412
13.1 Preservation of Conservation Laws in Bosonic Theories . . . 412
13.2 Breakdown of Conservation Laws in Fermionic Theories . . . 415
13.3 Wick Rotation and Fermionic Functional Calculus 417
13.4 The Abelian Anomaly 419
13.5 Functional Jacobians 422
13.6 Local Anomaly Theorems 425
13.7 Basic Topology for the Discussion of Global Anomalies . . . 428
13.8 The Topology of the Gauge Group 432
13.9 The Topology of the Space of Gauge Potentials 433
13.10 The Global Anomaly for Quantum Gauge Theories 435
13.11 Summary 437

14. $SU(3)$ Representation Theory 438
14.0 Introduction 438
14.1 $SU(3)$ Representations of Small Degree 439
14.2 Interpretation of $SU(3)$ as Flavor 443
14.3 Interpretation of $SU(3)$ as Color 444
14.4 $SU(3)$ Weight Diagrams 445
14.5 Tensor Representations 447
14.6 Splitting Tensor Products 449
14.7 Young Diagrams 451

Chapter 1

Relativistic Quantum Mechanics

Uniting the operator and state-space formalism of quantum mechanics with special relativity through a unitary representation of the Poincaré group.

Introduction

Chapters 1 to 5 constitute the first part of this book. They develop the theory of the scalar field from its roots in special relativity and quantum mechanics to its fruits in cross sections and decay rates. The technique of quantization developed here will be applied in the second part – Chapters 6 to 9 – to spinor and vector fields.

Taking quantum mechanics, with its formalism of state space, Hamiltonian, and observables, together with relativity, with its emphasis on invariance under Lorentz transformations, as the two major pillars or principles in our understanding of particle physics, the purpose of this chapter is to introduce a framework in which both principles coexist.

Section 1.1 clarifies the concept of a state space, putting physical states, position eigenstates, and momentum eigenstates into proper relationship. Section 1.2 takes the first step towards a relativistic quantum theory by promoting the energy and momentum observables into a Lorentz vector. Section 1.3 uses this vector to construct a unitary representation of translations on state space, Section 1.4 uses an independent construction to build a unitary representation of the Lorentz group, and Section 1.5 shows that these two representations determine a unitary representation of the Poincaré group. At this point, the principle of special relativity is effectively built into the formalism of quantum mechanics. Only the position operator has yet to be introduced. Section 1.6 shows that, if we adjoin eigenstates of the position operator to our state space, then there is a probability for signals to travel faster than light.

Although this probability is too small to be ruled out by experiments to date, we decide to uphold relativistic causality and drop the position operator from the theory. To model localization of events, we localize measurement using fields of observables.

For simplicity of notation, we shall choose units such that the speed of light c and the reduced Planck constant $\hbar$ are both unity:

$$c = 1 \quad \text{and} \quad \hbar = 1. \tag{1.0.1}$$

This choice of units reduces the three units time, length, and mass, to a single unit which we will generally call mass:

$$T = L = M^{-1}. \tag{1.0.2}$$

When it is necessary to compare with experiment, it will be easy to insert the factors of c and $\hbar$ which convert the units of a prediction into the units of the data. Indeed, if our result has units M^a and the physical units for the result should be $M^b L^c T^d$,

then consistency requires $a = b - c - d$ and the conversion is accomplished by the equation

$$(\text{Answer in units } M^b L^c T^d) = (\text{Answer in units } M^a) \times \hbar^{b-a} \times c^{a-b-d}. \quad (1.0.3)$$

Throughout this text, we shall take the metric on Minkowski space to be

$$g^{\mu\nu} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & -1 \end{pmatrix}, \quad (1.0.4)$$

and we use the dummy suffix conventions

$$\begin{aligned} a^\mu &= g^{\mu\nu} a_\nu, \\ a{\cdot}b = a^\mu b_\mu &= \sum_{\mu=0}^{3} a^\mu b_\mu = g^{\mu\nu} a_\mu b_\nu, \\ a^{2k} &= (a{\cdot}a)^k. \end{aligned} \quad (1.0.5)$$

1.1 One-Particle State Space – Mathematics

We want our one-particle state space to include states with definite energy and momentum. In fact we want more. We want a basis for state space in which the energy and momentum operators are simultaneously diagonal. To fulfill this desire, an excursion into mathematics is necessary. However, a little explanation will be sufficient for practical purposes. In this section, we present the little explanation and indicate the relevant mathematics in two remarks.

The function space used to model quantum-mechanical states is a Hilbert space H of square-integrable functions on physical space. The functions in H can be written either as functions of position $\bar{x}$ or as functions of momentum $\bar{p}$. The position-space representation is related to the momentum-space representation by the Fourier transform $\mathcal{F}$:

$$\mathcal{F}(f)(\bar{p}) \stackrel{\text{def}}{=} \int dx\, e^{i\bar{x}\cdot\bar{p}} f(\bar{x}). \quad (1.1.1)$$

Despite the change of independent variables from $\bar{x}$ to $\bar{p}$, the function $\mathcal{F}(f)$ is in H, and $\mathcal{F}$ maps H to itself.

Remark 1.1.2. Actually, if f is square-integrable, then the function $e^{i\bar{x}\cdot\bar{p}} f(\bar{x})$ is certainly square-integrable but it may not be integrable. To define the Fourier transform on H, it is necessary to define it first on some good subspace of H (such as the space of smooth functions with compact support) and then to use the fact that the Fourier transform is an isometry (up to a scale factor) on this subspace to extend the Fourier transform to an isometry of H itself.

The position operators X_r and momentum operators P_r are represented respectively by multiplication by coordinate functions x_r and the partial derivative operators $-i\partial_r$. The Fourier transform converts multiplication by x_r on functions of $\bar{x}$ into the differential operator $-i\partial_r$ on functions of $\bar{p}$:

$$\mathcal{F}(x_r f)(\bar{p}) = -i\partial_r \mathcal{F}(f)(\bar{p}). \quad (1.1.3)$$
