The quotation succinctly captures the character of the present text. We have witnessed dramatic changes in the field of economics in the last decade or so. In macroeconomics, a veritable explosion of knowledge has altered substantively the profession's views regarding the appropriate conduct of monetary and fiscal policies. Monetarism, supply-side economics, and rational expectations, ideas that were largely ignored or unheard of in the late 1960s and early 1970s, have all assumed center stage in today's macroeconomic policy debates. Microeconomics has undergone major transformations as well, as has the economist's view of the role of government in promoting efficiency in the allocation of resources. Relatively obscure specialties, such as the economics of exhaustible resources, externalities, poverty and discrimination, and health and safety regulation, have all emerged as major branches of the science. Even the staples of microeconomic analysis—the economics of market structure, antitrust policy, and international trade, for example—have not been left untouched.

The traditional tools of analysis have proved equal to the task of accommodating these rapid advances in economic knowledge. To put it differently, those tools of long standing in the economics profession, such as the demand and supply model, the production possibilities apparatus, and the aggregate demand–aggregate supply framework, have all proved to be sufficiently expansive and versatile to admit both a growing knowledge base and diverse points of view. “The more things change, the more they remain the same.”

The focus in *Economics: The Science of Choice* is on the tools of economic analysis, with special emphasis on their varied and versatile uses. In my view, a thorough grounding in those tools is essential to an understanding of the major economic problems of our times—inflation, unemployment, the energy crisis, inequities in the distribution of income and wealth, poverty, discrimination, pollution, an eroding natural resource base worldwide. Many introductory economics textbooks are written with a similar point of view. However, the study of the tools of analysis is pushed further in *Economics: The*

## Preface

*“The more things change, the more they remain the same.”*

Alphonse Karr  
*Les Guepes (1849)*

*Science of Choice*. In my estimation, this does not make the study of economics more difficult for the student. On the contrary, in fourteen years of teaching the introductory course I have found that familiarizing the student with the rich and varied features of the traditional tools of analysis makes the nature of our economic problems and of the policy options more understandable than otherwise. Going the extra distance enables the student to acquire a more thorough understanding of the implications of the diverse points of view found within the economics profession. This enhanced understanding is not accomplished by introducing the student to new and more sophisticated tools, but by extending and then exploiting the student's understanding of a few traditional tools.

### Some highlights of *Economics: The Science of Choice*

The Table of Contents provides an overview of the coverage of topics in *Economics: The Science of Choice*. Upon reading it, you will be struck by three things. First, this text is not an encyclopedia of issues in economics. To keep the length of the text moderate and to provide depth of coverage, I had to pick and choose from among the many and varied interests of economics. I limited my selection to what I believe are the major issues in macroeconomics and microeconomics.

Second, you will note the general absence of chapters specifically devoted to "policy applications." The policy issues are fully integrated with the theoretical discussions; in many instances, the policy issue itself provides the frame of reference for the study of the tools of the economic analysis.

Third, certain features of this text can be identified that set it apart from the competition.

General equilibrium analysis is introduced early in the text, at the end of Chapter 3. In my view, students have enough tools to readily handle the discussion there. They have been introduced to the production possibilities curve and to the demand and supply model. The point of the exercise is to

show the interdependencies between product markets and resource markets.

The broad outlines of President Reagan's *Economic Recovery Tax Act of 1981*, perhaps the most dramatic fiscal policy initiative undertaken in U.S. history, are set forth in Chapter 4. The theoretical underpinnings of that tax proposal are explored in Chapter 14.

The concept of the natural rate of unemployment is introduced in Chapter 5. The familiar demand and supply model is all that is required to illustrate this important idea. The discussion makes clear that the natural rate of unemployment is not some immutable constant, but depends on the distribution of excess demand and excess supply markets and the speeds of adjustment of wages in both.

The Keynesian and classical models of income determination are compared in Chapter 7. This discussion is an important prelude to the study of rational expectations in Chapters 13 and 14.

An unusually lengthy discussion is accorded to hotly debated issues surrounding budget deficits and the national debt in Chapters 8 and 11.

*The Depository Institutions and Monetary Control Act of 1980*, the most significant piece of legislation affecting U.S. financial institutions since the mid-1930s, is examined in Chapters 9 and 10.

Chapters 12, 13, and 14 constitute the heart of the macroeconomics portion of the text. The student is taken step by step from the comparative statics aggregate demand-aggregate supply framework (where the focus is on the theoretical determinants of the price level and real output) to a fully dynamic aggregate demand-aggregate supply model (where the focus is on inflation, unemployment, and growth). The model in Chapter 13 is then applied in Chapter 14 to the study of the major macroeconomics policy issues of our time.

In view of the importance of international monetary relations to the conduct of macroeconomic policy, the macroeconomics portion of the text closes with a discussion of the U.S. balance of payments and the international monetary system.

The focus of the discussion in Chapters 19 through 21 is efficiency in the allocation of resources under alternative market structures.

Chapter 25 focuses on the economics of exhaustible resources. There it is demonstrated that the usual marginal cost pricing criterion for efficiency would often result in resource misallocation.

Chapters 27 and 28 bring together a wide variety of issues dealing with the role of government in our economic system. The point of the entire discussion is simple: In the face of monopoly power and externalities, government intervention is often required in the interests of efficiency. How well government performs its role is touched on peripherally.

Chapters 29 and 30 present an in-depth examination of the costs and benefits of free trade and trade restrictions.

### Teaching and learning aids

Great care has been exercised to make *Economics: The Science of Choice* and accompanying supplementary materials, including a Student Guide, Instructor's Manual, Newsletter, and Test Bank, a highly effective package of teaching and learning aids. Considerable attention was given to clarity of presentation at a level of difficulty corresponding to the reading abilities of today's introductory economics students. Particularly important arguments and notable points of view are screened in blue for emphasis.

**Student guide.** One of the exciting learning aids accompanying *Economics: The Science of Choice*, is *Concepts and Language of Economics: A Student Guide*, written by my good friend and highly respected colleague, Dennis Sullivan of Miami University in Oxford, Ohio. *Concepts and Language of Economics* is extremely closely coordinated with the text and pedagogically is an important complement to the text and to the study and teaching of economics. I strongly urge its use along with the text.

**Instructor's Manual.** The Instructor's Manual is designed to serve three purposes. First, it provides a detailed list of the learning objectives for each chapter of the text. Second, outline answers to the questions at the end of each chapter reduce the instructor's burdensome chore of preparing answers for distribution to students. Third, for each chapter in the text the Instruc-

tor's Manual provides Tips and Suggestions in the form of case studies, supplementary readings, and teaching ideas that I have found useful over the years. Transparency masters are available upon request.

**Test Bank.** A Test Bank, available on request to users of the text, has been prepared by myself and Dennis Sullivan. The Test Bank contains both multiple choice and true-false questions, each coded to one of three levels of difficulty. Recognizing the problems instructors encounter when they use text banks containing ambiguous items or incorrectly answered questions, we have drawn extensively from our own personal test banks to ensure, as far as possible, that each question has been classroom tested. The Test Bank is available in computerized format.

**Newsletter.** Twice yearly, a Newsletter will be prepared by the author and made available to all instructors adopting the text. The Newsletter will not have any preset format. Generally, it will be used as a vehicle for updating statistical charts and tables contained in the text, for discussing current policy issues, and for drawing attention to new theoretical and empirical discoveries.

### Acknowledgments

In an undertaking as large as *Economics: The Science of Choice*, one incurs a large stack of debts. I seem to owe an unusually large number. Indeed, I am hard-pressed to find very much to offset the huge gifts of time and energy that have been given to me over the course of the past four years while this text was being written, rewritten, and rewritten again.

First, I want to express my deepest appreciation and thanks to my colleague and close friend, Edward F. McKelvey, chief of the Capital Markets Section of the Board of Governors of the Federal Reserve, who not only collaborated with me in writing Chapters 4, 5, and 9 of the book, but who also volunteered to serve as proofreader of the text when it was in pages. I doubt that I will ever be able to repay these debts. Of course, Ed's contributions to this text are his own and

do not necessarily represent the views of the Board of Governors of the Federal Reserve System or any of its other staff members.

An equally large debt is owed to Dennis Sullivan, author of *Concepts and Language of Economics: A Student Guide* that accompanies *Economics: The Science of Choice*. Not only did he leave his mark on this undertaking with the publication of his invaluable Student Guide, but he also served as my finest critic through each of the several drafts of the text. His detailed comments so heavily influenced the final product that I am tempted to shift some of the responsibility for any remaining errors onto his shoulders. But, alas, any remaining errors are mine and mine alone. However, if any credits are to be given, Dennis should share in them.

Next, I want to thank the many reviewers who offered valuable comments on the several drafts of the manuscript: Robert M. Aduddell, Loyola University; Richard K. Anderson, Texas A&M University; Orley Ashenfelter, Princeton University; Frank J. Bonello, University of Notre Dame; Martin S. Feldstein, Harvard University; Harold D. Flint, Montclair State College; J. Fred Giertz, University of Illinois; Robert J. Korbach, University of North Dakota; Peter H. Lindert, University of California-Davis; Roger Magyar, Sacramento City College; Virginia Owen, Illinois State University; Robert L. Pennington, George Mason University; Andrew J. Policano, University of Iowa; Richard Roehl, University of Michi-

gan-Dearborn; John C. Soper, Northern Illinois University; Robert Strom, University of Missouri-Columbia; Craig West, Federal Reserve Bank of Kansas City; Donald Yankovic, University of Toledo.

A very special thanks goes to Linda Maisel, typist extraordinaire, who cheerfully accepted my completely unreasonable deadlines without complaint. My apologies at the time seemed inadequate, so let me emphasize again, "I'm sorry."

The tally of these debts, sizable though it is, is small by comparison with the debt I owe to my family—to my wife, Sherry, and to my two sons, Scott and Stefan. Sherry performed an unusual number of roles in the production of this text. As an economist in the Banking Section of the Board of Governors of the Federal Reserve System, she was extremely valuable as a critic and as a sounding board for my ideas. Her patience, understanding, and encouragement, and her willingness to take on much more than her fair share of household chores and family obligations, were critical ingredients to the successful completion of this work. I owe her a great deal, and I trust that she will now accept my profuse thanks as but a small down payment for a debt piled high. To my sons: I know I cannot turn the clock back to retrieve the hundreds of weekends when I was locked away in my study. But I *can* promise to share with you future weekends.

*Lloyd C. Atkinson*

Part one	
Basic concepts . . . . .	3

1. The study of economics . . . . .	5
The elements of an economic problem . . . . .	5
<i>Scarcity: A fact of life. The nature of our scarce resources. The common thread: Scarcity. Scarcity and the choices we make. Scarcity, choice, and mutual dependence.</i>	
Economics: The science of choice . . . . .	8
<i>Evaluating choices: Opportunity costs. A word of caution.</i>	
The methodology of economics . . . . .	9
<i>The need to simplify to abstract.</i>	
A laboratory methodology applied to real-world experience: <i>Ceteris paribus</i> and all that . . . . .	11
<i>Economic theory: An illustration.</i>	
Economic laws: Problems . . . . .	13
<i>Values: Normative versus positive economics. The estimation of economic relationships.</i>	
2. Scarcity, choice, and mutual dependence . . . . .	17
The economic problem . . . . .	17
<i>Production possibilities. Opportunity costs.</i>	
Scarcity and the optimum product mix . . . . .	21
<i>Behind optimum product mix: Optimum resource mix. Efficiency.</i>	
The growth process . . . . .	26
<i>Gross investment and net investment. Growth and some aspects of the problem of underdevelopment. Growth and other investments. Growth and technology.</i>	
The economic problem: The four fundamental questions . . . . .	30
<i>What to produce. How to produce. How to distribute output. How extensively to use resources. Solving the economic problem.</i>	
3. Prices, markets, and resource allocation . . . . .	35
Prices and markets: Laissez-faire capitalism . . . . .	36
<i>The circular flow of economic activity: A first view. Price determination in a single market. Demand. Rationale for the law of demand. Individual demand and market demand. Changes in the quantity demanded and changes in demand. Supply.</i>	

## Contents

*Product supply. Rationale for the law of supply. Two further notes on supply. Product market equilibrium. Surpluses and shortages. Changes in demand and supply. Ceteris paribus revisited. Demand and supply in resource markets. The factor price equalization theory.*

Partial equilibrium and general equilibrium: Resource and product market . . . . . 52  
*Relative prices. Consumer sovereignty. General equilibrium and "the invisible hand." Laissez-faire capitalism and the four fundamental questions. Laissez-faire capitalism: A preliminary evaluation. Prices and markets: Mixed and planned economies.*

The circular flow of economic activity . . . . . 59

4. Mixed capitalism: Business firms and the government . . . . .	63
The private business sector . . . . .	63
<i>Corporate finance: Equity, debt, safety, and leverage. Business accounting relationships. The income statement and the balance sheet: Stocks versus flows.</i>	

The economic role of government . . . . . 71  
*Government regulation. Public goods. Income redistribution. Economic stabilization. Noneconomic functions of government. Federal, state, and local governments. How big is government? Distribution of government expenditures and taxes. The social balance question. The U.S. tax system. The U.S. federal tax system.*

## Part two

**Macroeconomics: Employment, inflation, fiscal policy, monetary policy, economic stability, and economic growth . . . . . 95**
**5. National economic goals and goal conflicts: An analysis of the record . . . . . 99**

The goal of full employment . . . . . 100  
*Measuring employment, unemployment, and the labor force. The unemployment rate as a measure of the problem of unemployment. Kinds of unemployment. The natural rate of unemployment.*

The goal of price stability . . . . . 117  
*Measuring price stability and inflation. Defining inflation. The costs of inflation. Redistribution effects of inflation. Output and employment effects of inflation. Creeping versus double- or triple-digit inflation: How much inflation is too much? Are the goals of full employment and price stability in conflict?*

The goal of rapid economic growth . . . . 128  
*The growth process. The goal of rapid economic growth and the goals of full employment and price stability. Growth and other economic goals.*

Other goals . . . . . 135  
*A fair and equitable distribution of income. A desirable mix of goods and services.*

**6. The national income and products accounts . . . . . 139**

Gross national product (GNP) . . . . . 139  
*GNP defined. Market value. Final goods. Production versus sales. The time period. Market versus nonmarket activities.*

Gross national income . . . . . 148  
*The equivalence of income and the value of output. GNP and NNP. National income (NI). Personal income (PI). Disposable personal income (DPI). The various income concepts and their interrelationships: A summary.*

Potential GNP . . . . . 156  
*Potential GNP versus actual GNP. GNP—A measure of welfare?*

**7. Static models of income determination: The classical and Keynesian approaches . . . . . 163**

*The need to simplify.*

The concept of macroequilibrium . . . . . 164

Two approaches to income determination 166  
*The classical theory of employment and income. The Keynesian critique. The Keynesian theory of employment and income. The simple multiplier. Equilibrium at full employment?*

**Appendix: The short-run and long-run consumption function**
**8. Fiscal policy and national income determination: A static approach . . . . . 190**

*Background material: Our assumptions modified. The concept of macroequilibrium reconsidered.*

The theory of employment and income with government included . . . . . 192  
*The equilibrium level of national income. Government spending and the multiplier. The multiplier (more generally). Taxes and the multiplier. The balanced budget multiplier.*

Fiscal policy and the inflationary and deflationary gaps . . . . . 200

Automatic stabilizers . . . . . 202  
*Fiscal drag. Automatic stabilizers and passive changes in the budget. Policy-induced changes in the budget. Policy-induced and passive changes in the budget combined. The full employment (or high employment) budget. Measuring fiscal stimulus and contraction: Problems with the full employment budget.*

Deficits, surpluses, and the national debt 209  
*Alternative budget strategies. The national debt.*

Problems with the implementation of fiscal policy . . . . . 217

**9. Money and the U.S. financial system . . . 221**

Functions of money . . . . . 221  
*Defining money. The monetary and credit aggregates in the United States. The changing definition of money. The importance of defining money.*

The optimum quantity of money . . . . . 227  
*The equation of exchange. The value of money.*

The U.S. financial system . . . . . 231  
*The Federal Reserve System. Other financial institutions.*

Money and capital markets . . . . . 239

<b>10. Credit expansion and contraction . . . . .</b>	<b>244</b>		
Credit expansion and contraction: A first approximation . . . . .	244		
Money creation via loans. Money creation via bank financial investments. The deposit expansion potential: The volume of reserves and the reserve requirement. Total reserves, required reserves, and excess reserves. The check-clearing process. Loan expansion: A single depository institution versus the system of depository institutions. The deposit expansion potential: An alternative presentation. The federal funds market.			
The tools of monetary policy and the deposit expansion potential . . . . .	252		
Open market operations. The discount rate. The reserve requirement. Some minor tools of monetary growth.			
Credit expansion and contraction: Some complications . . . . .	256		
Currency holdings. Desired excess reserves. Non-checkable deposits and other financial assets.			
The difficult task of interpreting monetary policy . . . . .	263		
The public's holdings of currency. Depository institution borrowing from the Fed. Treasury deposits at the Fed. Gold sales and purchases. Foreign deposits at the Federal Reserve. Foreign exchange purchases and sales. Changes in bank reserves: A summary. Dynamic versus defensive operations.			
<b>11. Money and the level of economic activity: A static analysis . . . . .</b>	<b>268</b>		
The inverse relationship between bond prices and interest rates . . . . .	269		
Present discounted value (PDV).			
Interest rate determination: A first approximation . . . . .	273		
The demand for money. The total demand for money. Liquidity preference and changes in income and wealth. Equilibrium in the money market. The money supply and the interest rate.			
The impact of interest rates on aggregate demand . . . . .	280		
The marginal efficiency of investment (MEI). Money, investment, the multiplier, and the level of economic activity.			
Monetary policy and the inflationary and deflationary gaps . . . . .	284		
Other channels of monetary influence	285		
		The monetarist-fiscalist debate . . . . .	285
		Velocity of circulation revisited. Fiscal policy, money, and the level of economic activity. The differences between the monetarists and the non-monetarists are empirical.	
<b>12. Aggregate demand, aggregate supply, and the price level . . . . .</b>	<b>294</b>		
Aggregate supply and the price level	295		
The importance of a theory of aggregate supply. Alternative views of the aggregate supply relationship. Potential GNP: An aside. Aggregate supply below potential GNP. The short-run aggregate supply curve: A classical view. The Keynesian perspective. The upward-sloping aggregate supply curve. Three additional notes on aggregate supply.			
Aggregate demand and the price level	306		
Summing up the aggregate demand relationship.			
Aggregate supply, aggregate demand, and the price level . . . . .	310		
The long-run equilibrium price level. Changes in the price level in the long run. Output and price level determination in the short run. Short-run price, output, and employment changes: Shifts in AD. Short-run price, output and employment changes: Shifts in $AS_{SR}$ .			
<b>13. The macrodynamics of aggregate demand and aggregate supply . . . . .</b>	<b>317</b>		
The meaning of inflation . . . . .	317		
The inflation process: An overview . . . . .	318		
The demand-pull rate of inflation. The price-shock rate of inflation. The core rate of inflation.			
Aggregate demand, aggregate supply, and inflation . . . . .	321		
Long-run aggregate supply and inflation. Short-run aggregate supply and inflation. Four additional notes on aggregate supply. Aggregate demand and inflation.			
Aggregate demand, aggregate supply, inflation, and inflationary expectations: Putting the pieces together . . . . .	336		
A permanent increase in the rate of money growth. A permanent reduction in the rate of money growth. A change in fiscal policy. Price-shock changes in the price level.			
A summary note on the inflation process	342		

<b>14. Unemployment, inflation, and growth: Demand management and supply-side policy issues . . . . .</b>	<b>346</b>	
Unemployment and inflation dynamics . . . . .	347	
<i>The relationship between unemployment and inflation: The facts. Making sense of the unemployment-inflation facts. The demand-pull, price-shock, and core rates of inflation. Demand management versus an income policy to slow inflation.</i>		
Supply-side policies and the anti-inflation potential of fiscal policies . . . . .	363	
<i>The importance of marginal tax rates. Supply-side economics, economic growth, and inflation.</i>		
<b>15. The balance of payments and the international monetary system . . . . .</b>	<b>370</b>	
The balance of payments . . . . .	371	
<i>The U.S. balance of payments.</i>		
The determination of foreign exchange rates . . . . .	374	
<i>The U.S. demand for foreign goods and services and the demand for foreign exchange. The demand curve for foreign exchange. The foreign demand for U.S. goods and services and the supply of foreign exchange. The U.S. bilateral balance on goods and services: A graphic representation of the demand for and supply of foreign exchange. The overall balance on goods and services account. The overall balance on current account. Capital account transactions. Adding capital flows to the demand for and supply of foreign exchange.</i>		
Fixed versus floating exchange rates: Some of the issues . . . . .	387	
<i>Defining fixed and floating exchange rates. Maintaining fixed exchange rates: The need for coordinated macroeconomic policies. Incentives to adopt floating rates of exchange. The need for macroeconomic policy coordination under floating rates.</i>		
<b>Part three</b>		
<b>Microeconomics of consumer and business behavior: Price and output determination in product markets . . . . .</b>		
<b>16. Demand, supply, and the elasticity concept . . . . .</b>	<b>399</b>	
Demand, supply, and the market price . . . . .	399	
<i>Changes in demand and supply.</i>		
The elasticity concept . . . . .	403	
<i>The price elasticity of demand. The arc-price elasticity of demand: The mid-points formula. Variations in the price elasticity of demand. The price elasticity of demand and total revenue. Determinants of the price elasticity of demand. The income elasticity of demand. The cross-price elasticity of demand. The price elasticity of supply.</i>		
Some applications of the elasticity concept . . . . .	414	
<i>Price controls. A brief review of the U.S. farm problem. The incidence of an excise tax.</i>		
<b>17. Utility theory and the theory of demand . . . . .</b>	<b>425</b>	
The theory of consumer choice: The individual consumer . . . . .	425	
<i>The law of diminishing marginal utility. Utility maximization: The equimarginal principle.</i>		
The equimarginal principle and the law of demand . . . . .	430	
<i>The law of demand: Income and substitution effects.</i>		
Demand: Some concluding comments . . . . .	432	
<i>Consumer surplus. The diamond-water paradox.</i>		
Some concluding observations on demand theory and the theory of consumer choice . . . . .	435	
<b>Appendix: Indifference curve analysis</b>		
<b>18. Costs, profits, and product supply . . . . .</b>	<b>438</b>	
The firm's objective: Profit maximization . . . . .	438	
Costs . . . . .	439	
<i>Opportunity costs versus accounting costs. Short-run and long-run production costs.</i>		
Short-run costs . . . . .	441	
<i>The law of diminishing returns (or the law of diminishing marginal productivity). Total variable cost, average variable cost, and marginal cost. Other cost concepts: Average total cost (ATC) and average fixed cost (AFC). Short-run production costs: A summary.</i>		
Long-run costs . . . . .	449	
<i>Economies and diseconomies of scale.</i>		
Revenues . . . . .	453	
<i>Individual firm demand and market demand. The firm's revenues: A summary.</i>		
The profit-maximizing rule . . . . .	456	

<b>19. Pure competition and competitive product supply</b> . . . . .	<b>460</b>	<i>ing controversy. Product innovation, technological advance, and monopolistic competition.</i>
The nature of pure competition . . . . .	460	
Short-run profit maximization: The purely competitive firm . . . . .	461	<i>The theory of oligopoly . . . . . 506</i>
<i>Profit maximization. Loss minimization. Loss minimization: The shutdown case. Some conclusions from the numerical examples. The profit-maximizing example illustrated graphically. Profit maximization and loss minimization: A general graphic representation. The perfectly competitive firm's short-run supply curve. The market supply curve. Producer's surplus.</i>		<i>Economies of scale as the cause of fewness. The consequences of fewness: Recognized mutual interdependence. The mood to collude. Collusion and monopoly. The incentives to cheat. What determines the success or failure of collusion? The kinked demand curve. Price leadership and the kinked demand curve.</i>
Long-run adjustments in purely competitive industries . . . . .	470	
<i>The long-run supply curve in a perfectly competitive industry. A note on the perfectly competitive long-run equilibrium: Statics versus dynamics.</i>		
<b>20. Monopoly and pure competition: A study of contrasts</b> . . . . .	<b>478</b>	<b>Part four</b>
Profit maximization under monopoly . . . . .	478	<b>Microeconomics of consumer and business behavior: Price determination in resource markets and distribution of income</b> . . . . .
<i>Price, marginal revenue, and downward-sloping demand. An aside: Marginal revenue and the price elasticity of demand. Short-run profit maximization: A numerical example. The profit-maximizing monopolist: A graphic analysis. Profit maximization and loss minimization illustrated. Monopoly and long-run equilibrium.</i>		<b>517</b>
The efficiency losses of monopoly . . . . .	487	<b>22. Theory of production and resource use</b> . . . . .
<i>The meaning of efficiency losses.</i>		<b>521</b>
An additional advantage of competition over monopoly: Price equal to the lowest cost per unit . . . . .	490	<i>Resource demand and the concept of "derived" demand.</i>
An offset to the efficiency losses: Economies of scale . . . . .	490	<i>The demand for a single variable factor of production . . . . . 522</i>
Natural monopolies . . . . .	492	<i>A restatement of the profit-maximizing rule. The demand for a single factor of production: The short run. The MRP schedule. Marginal revenue product (MRP) and value marginal product (VMP). Some consequences for resource use of monopoly power in product markets.</i>
A concluding note on natural monopolies . . . . .	493	<i>Resource market equilibrium: The case of perfect competition . . . . . 529</i>
<b>21. Monopolistic competition and oligopoly</b> . . . . .	<b>495</b>	<i>The market demand curve for a factor of production. The market supply curve of a factor of production. The market labor supply curve. Competitive labor market equilibrium.</i>
Monopolistic competition and oligopoly described . . . . .	496	<i>Resource market equilibrium: The case of imperfect competition . . . . . 533</i>
<i>Characteristics of monopolistic competition. Characteristics of oligopoly. A word of caution.</i>		<i>Monopsony equilibrium. Some consequences for resource use of monopsony power in resource markets. Monopolistic exploitation and monopsonistic exploitation combined.</i>
Price and output determination under monopolistic competition . . . . .	497	<i>The firm's demand for several variable factors of production: The long run . . . . . 536</i>
<i>Profit maximization in the short run. Long-run equilibrium under monopolistic competition. "The wastes of competition." Product differentiation. Nonprice competition. Advertising. The advertis-</i>		<i>The least-cost rule. The substitution rule.</i>
		<b>23. Labor income: Its determination and distribution</b> . . . . .
		<b>540</b>
		<i>Wage determination under perfect competition . . . . . 541</i>
		<i>The determination of the real wage rate for a single "grade" of labor. The marginal productivity</i>

- theory of wages and distribution. Real wage differences in perfectly competitive labor markets. Sources of wage differences under perfect competition. One source of real wage differences in perfectly competitive markets—all jobs are not alike. Another source of real wage differences in perfectly competitive markets—all people are not alike. General equilibrium in perfectly competitive labor markets.*

## Index . . . . . 709

The Alfred Nobel Memorial Prize in Economic Science was officially established in 1968 under a donation by the Central National Bank of Sweden to mark its 300th anniversary. Alfred Nobel, who died in 1896, was a millionaire best known for his invention of dynamite. His will established a fund for monetary awards to persons who have worked for peace as well as to persons who have benefited mankind through their contributions in the fields of literature, physics, chemistry, medicine, and psychology. The awards have been given annually since 1901. However they have occasionally been withheld in one or more categories, especially the peace prize.

The award for Economic Science is the only addition to the five categories as set up by the Nobel Foundation. It is administered in the same way as the others and the cash value is identical—in 1981 the equivalent of \$180,000. The Swedish Academy of Sciences is responsible for determining the recipients for all of the prizes. The criteria for selecting the winners in economics is based on "the achievements on their scientific merits," and the rules generally require a "discovery," though that may be broadly defined to include a different approach or use of previous works. Although the public is most eager to know what the "work" implies for public policy, invariably the technical or scientific contributions of its economic laureates are stressed in the citation.

Between 1969, when the first Economic Science award was made, and 1981, 19 persons have received or shared one of the 13 coveted awards—6 were joint awards. Several of the recipients have been politically active; however the citations have carefully avoided any commentary on their political or social orientations.

Ragnar Frisch and Jan Tinbergen were joint winners of the first Alfred Nobel Memorial Prize in Economic Science in 1969. Both were recognized by the Nobel committee for their pioneering work in the areas of econometrics and mathematical economics. Their work brought greater precision to economic policymaking.

### Ragnar Frisch (1895–1972)

A pioneer in the development of mathematical methods for analyzing economic phenomena, Ragnar Frisch—a Norwegian—was noted for his contributions in mathematical economics and applied econometrics.

Wide World Photos

Frisch was one of the founders of the Econometrics Society in 1931 and was chief editor of its journal, *Econometrica*, until 1955. He is perhaps best known for his writings on the use of models as tools for the design of economic policies. Today, his ideas are widely accepted in all parts of the world. The Oslo model, a statistical-economic planning system is the product of his many years of research at the Oslo University.

Frisch was one of a group of university professors whom the Nazis imprisoned in a concentration camp during World War II. A huge, intense, strong-willed man, Frisch was also a beekeeper and an expert in the genetics of bees.

### Jan Tinbergen (1903– )

Working principally in applied econometrics and occasionally in the field of mathematical economics, Jan Tinbergen is associated with the Netherlands School of Economics in Rotterdam. His work in the development of the first large-scale model of the U.S. economy during the Great Depression of the 1930s served as the main stimulus to the development of the modern techniques of economic forecasting.

Subsequent to World War II Tinbergen served as advisor to the governments of several developing and emerging nations in Africa, Asia, and Latin America, devoting most of his efforts to improving economic planning for long-term growth. More recently his chief activity has been to focus on problems of income distribution and a program for world economic development.
