A study guide has been developed to assist you in mastering concepts presented in this text. The study guide reinforces concepts by presenting them in condensed, concise form. Additional illustrations and examples are also included. The study guide is available from your local bookstore under the title *Study Guide to Accompany Computers and Data Processing Today*, prepared by Steven L. Mandell.

PREFACE

In the last few years there has been an explosion in the number of students taking first courses in computers and data processing. This explosion has resulted in the need for a wide variety of books and teaching materials. In the time since the First Edition of *Computers and Data Processing* was published, I've had numerous inquiries into the possible availability of an introductory computer text that would be more concise and briefer than *Computers and Data Processing*, but maintain its clarity and teaching style. Two years of hard work with my publisher have resulted in the book you hold in your hand—*Computers and Data Processing Today*. I believe that this book continues my philosophy of presenting the educational material in a logical, uncluttered manner, while including relevant real-world examples. Additionally, by virtue of its full-color format and extensive use of graphics, I believe this book is one of the most visually appealing introductory computer books yet published.

In structuring the material to be included in this book, I worked closely with my introductory students at Bowling Green State University trying out different teaching approaches. I taught several experimental sections of the introductory computer course, shifting some of the programming material to a very early stage in the course. This afforded the students an opportunity to begin their laboratory experience (BASIC on Apples) after the second week. Tradition has always placed this material after hardware, but I found the students were able to grasp programming concepts prior to knowing the technology. The extremely positive feedback I received from the students concerning this non-traditional approach led to the new organizational

structure in this book. This organization was further reinforced by certain first draft reviewers, who in fact, reported that they often teach their courses in this fashion and thus were most receptive to this new ordering of materials. However, even with this new organization the book remains flexible enough for the instructor to reorder the topics in any order he or she chooses. The book, therefore, remains an extremely flexible teaching device.

The basic pedagogical format found in this book is designed to aid in the clear, straightforward presentation of the material, while including motivational real-world examples. Each chapter begins with a brief introductory section that provides a logical link with the previous material. The chapter outline that follows permits the student to develop a frame of reference for the text material. This outline also provides a useful guide when preparing for exams. At the conclusion of the chapter material, there is a point-by-point summary in sentence form followed by approximately ten review questions.

Two additional features in the pedagogical design warrant special attention, and are also related to the title of this book, *Computers and Data Processing Today*. Several Highlight boxes are included in each chapter that present material of current interest. These materials are designed to be motivational and entertaining, while at the same time providing current perspectives that enrich the book's content. The Highlights appear in the margins so as not to break up the flow of the text material. Secondly, because of the tremendous proliferation of microcomputers today, it became apparent that adequate attention had to be devoted to their special requirements. This arose both from my own teaching experience as well as from comments received from instructors all around the country. Rather than just including a separate chapter on microcomputers, the decision was made to integrate this information throughout the book by providing a separate "Focus on Microcomputing" section at the end of each chapter. This section integrates microcomputer concepts and applications into the material discussed in that particular chapter. This should prove to be an extremely valuable addition for students entering a "micro world."

The importance of good flowcharting techniques can never be underestimated. This was also made clear to me in reviews of a preliminary version. Therefore, in the book, the flowcharting material presented in the text and in the BASIC/Pascal appendices is augmented through the use of a separate appendix entitled "Common Program Logic Flowcharts." Individuals with courses utilizing a language laboratory will find this addition provides significant flexibility in teaching program design. A second appendix, "Career Opportunities," is also included to give students a practical insight into computer-related careers. Finally, at the end of the text is a comprehensive glossary and a separate index.

In order to provide appropriate materials for the widest variety of teaching situations, there are three versions of this book available. First a version with a very complete BASIC language supplement expanded to include microcomputer implementation; second, a version with a Pascal supplement; and finally a language free version.

Finally, as I indicated above, I was very fortunate to have had several outstanding college educators serve as reviewers for this project. It is very difficult to fully express my thanks for their help and aid in shaping this project. Without the professional efforts of the following individuals, this book would not be nearly as effective a teaching vehicle: Don Cartlidge, New Mexico State University; James W. Cox, Lane Community College, Oregon; Richard H. Harms, Santa Ana College, California; Fred L. Head, Cypress College, California; Kathleen Ott, New Mexico Junior College; Curtis G. Rawson, Kirkwood Community College, Iowa; Al Stehling, San Antonio College; Rein Turn, California State University, Northridge; Kenneth W. Veatch, San Antonio College; Louis A. Wolff, Moorpark College, California.

A special debt of appreciation goes to Professor Fred Head of Cypress College and to Professor Kathleen Ott, New Mexico Junior College, who in addition to reviewing the entire manuscript, helped greatly in the completion of the "Focus on Microcomputing" Sections. Their meeting a very tight timetable, their good nature, dedication, and enthusiasm will long be remembered.

SUPPLEMENTARY EDUCATIONAL MATERIAL

The Study Guide to accompany this text includes numerous materials for student reinforcement. Each chapter in the Study Guide includes the following: Key Terms; a Narrative Summary of the chapter; a Structured Learning Section; an extensive set of Questions and Answers (True/False, Matching, Short Answers). The format for the student materials supporting the language supplements is slightly different. For each section in the language supplement there is: Structured Learning, Worksheet, and Programming Problems.

A complete instructor resource package has been designed to reduce administrative efforts. The classroom support includes: Learning Objectives, Detailed Outlines, Answers to Review and Discussion Questions, and Additional Review and Discussion Questions. Extensive materials have been included for language versions of this text. For each section in the language supplement, there are an average of four programming problems; each problem is accompanied by a flowchart and a list of any differences for microcomputers.

A Test Bank of over 1,000 multiple choice questions is also included in the Instructor's Manual. In addition, the WESTEST computerized testing service is available from West Publishing Company with these questions in machine-readable form.

There are over 100 Transparency Masters provided. Most of these visuals are novel, and not mere reproductions of artwork found in the text. Additionally, a narrative script of a tour of a modern computer facility is provided to augment a set of color slides available to adopters from West Publishing Company.

ACKNOWLEDGMENTS

Many individuals and companies have been involved in the development of the material for this book. Numerous corporations and government agencies provided the color pictures found in this book in addition to applications material. Many professionals provided the assistance required for a completion of a text of this magnitude: Rod Harris, Pat Cooke, Robert Szymanski, Rebecca Parks, Patricia Ostrowski on student material; Terrye Gregory and Stephen Gregory with BASIC and Pascal; and Norma Morris, Donna Pulschen, and Candace Streeter in manuscript development. The design of the book is a tribute to the many talents of William Stryker. One final acknowledgment goes to my publisher and valued friend, Clyde Perlee, Jr., for his encouragement and ideas.

Steven L. Mandell
