PREFACE

The primary objective of this book is to teach advanced COBOL programming skills to students who have already had one beginning COBOL course. Seven main topics are covered in 12 chapters. The topics are: report writer, table handling (tables of one, two, and three dimensions), sorting and merging, file maintenance (sequential, indexed, and relative files), string processing, subprograms, and debugging. Forty-four complete, working COBOL programs are shown in facsimile, along with their inputs and outputs. Additional figures show the JCL needed to run the programs under OS, and the commands needed to create several different VSAM files.

The programs are written to comply with the highest level of the 1974 American National Standard COBOL and with IBM OS/VS COBOL. The programs should therefore run on most compilers in use today. Where the ANSI standard and the IBM compiler are incompatible, as in a few minor instances in report writer, incompatibilities were resolved in favor of the compiler so that the programs shown in this book would run.

There is no discussion in this book of older systems that may not have all the capabilities of 1974 standard COBOL. If you are using one of the older systems, you may find that some of the features used in some of the sample programs in this book are not available to you. If this is the case, you will have to develop alternative methods to code those features. For example, if your COBOL system does not allow the slash (/) as an editing character, you will have to modify some of the sample programs to avoid using it.

This text assumes that the student is familiar with the topics usually covered in a beginning COBOL course, such as those contained in Chapters 1–8 of my book *Introductory Structured COBOL Programming* (Kent, 1981). Professional programmers who are working in a language other than COBOL, and who know some COBOL and wish to become proficient in it, will probably also find this book suitable.

The book is organized in modular fashion. Although I recommend covering the chapters in the order in which they appear in the book, an advanced course could be taught with only the following chapters required, in this order:

- 4. Sorting and Merging
- Magnetic File Media
- Processing Sequential Master Files

All other chapters can be covered at any time after their prerequisite topics are covered. The remaining chapters and their prerequisites are:

	8	reserve Assessed as an
	Chapter	Prerequisite
1.	Report Writer	None
2 .	One-Dimensional Tables	None
3.	Two- and Three-Dimensional	
_	Tables	One-Dimensional Tables
7.	Indexed Files	Processing Sequential Master Files
8.	Relative Files	Processing Sequential Master Files and
		One-Dimensional Tables
9.	Introduction to VSAM File	
	Processing	Indexed Files or Relative Files

Chapter

10. String Processing One-Dimensional Tables

11. Subprograms None

12. The Debugging Feature One-Dimensional Tables

I recommend that you cover Report Writer first and then use it in all programs in all subsequent chapters, as I have done. This approach has the substantial advantage of simplifying all programs and permitting the student to concentrate on a substantive topic. For example, in programs on file maintenance, use of Report Writer greatly simplifies the coding relating to the printing of error reports and transaction registers, and permits the student to concentrate on the logic of file processing. If for any reason you cannot or do not wish to use Report Writer, students will have to code the functions of page overflow, control breaks, line formatting, and line spacing by hand. Methods of coding such functions are covered fully in beginning COBOL textbooks and are not repeated here. See, for example, Chapters 2 and 6 of Introductory Structured COBOL Programming for full treatment of those topics, with programming examples.

Prerequisite

The approach used to teach programming skills is practical and intuitive. Abstract statements are kept to a minimum. Examples are used abundantly, especially examples of complete programs. Exercises are placed within the body of each chapter (except Chapter 9) to reinforce each topic where it is discussed. Each chapter contains a summary and fill-in exercises, and 11 of the 12 chapters have review exercises which cover all the topics of the chapter.

Each chapter begins with a list of key points that the student should expect to learn from the chapter, followed by a list of key words contained in the chapter. At the first appearance of each key word in the body of the chapter, the word appears in bold face, where it is explained and used in context.

An Instructor's Manual contains teaching suggestions for each chapter, answers to the chapter exercises, and numerous transparency masters for classroom use.

I wish to thank these people for their help in putting this book together: Myron R. Myerson, Instructor of Data Processing at New York City Technical College, who wrote many of the program examples, provided programming ideas, and made valuable suggestions on the manuscript; Shameze Sultan and Ronald Charles, then both students at NYCTC, who wrote many program examples; Frank M. Rand, Chairman of the Data Processing Department at NYCTC, who provided me with the necessary time and equipment; Michael L. Trombetta of Queensboro Community College for providing research materials and programming suggestions; Louise Moran of New York Life Insurance Company for providing programming suggestions; and James Cronenof the NYCTC Computer Center for valuable assistance in preparing the manuscript.

The author also wishes to to thank the following reviewers for their many useful suggestions in the preparation of the manuscript:

Robert D. Chenoweth Mike Marlow

CHAPTER 1

REPORT WRITER AND DECLARATIVES

Here are the key points you should learn from this chapter:

- 1. The concept of automatic generation of coding for report output
- 2. The features of the COBOL Report Writer
- 3. How to use Report Writer to produce a variety of reports
- 4. How to use declaratives in connection with Report Writer

Key words to recognize and learn:

Report Writer declarative Report Section REPORT IS report name

The Report Writer feature of COBOL makes programming for report output easier. The Report Writer provides, automatically, coding that would otherwise have to be written step by step by the programmer. Using Report Writer, the programmer can describe certain characteristics that the output report is to have, and Report Writer generates the coding needed to make the report look that way. For example, Report Writer can provide all the page overflow coding needed in a

program. The programmer need only tell Report Writer how big the page is, and Report Writer provides coding that will count lines as they print, test for page overflow, and skip to a new page and print headings when necessary. Report Writer can also provide coding that will take totals. If a total line is to print at the end of a report, the programmer need not code any of the totaling logic but just tell Report Writer which fields are to be totaled, and all the necessary coding will be provided automatically.

Report Writer also contains control break logic. If control breaks are needed on a report, the programmer need only say what the control fields are, and Report Writer provides coding to test for control breaks and print the appropriate total lines.

Another feature of Report Writer that makes programming easier is the way that output line formats are specified in Report Writer. Just tell Report Writer in which print position each field is to print, and it provides all the necessary coding. There is no need to count FILLER spaces.

There have been many schemes to automatically produce programs that print reports. But Report Writer is more than a means to produce reports. Report Writer is the printing component of the whole powerful COBOL language. In using Report Writer, the programmer does not give up any of the capabilities of COBOL; the programmer still has command over all the output editing features, the nested IF, and compound conditions. Thus Report Writer should be used in any COBOL program that produces printed output. For no matter what else the program might be doing, no matter how large the program or how involved the logic, and no matter the volume of printed output produced by the program, Report Writer should handle the formatting and printing of all lines.

Even though Report Writer is extremely flexible and powerful, it sometimes happens that the programmer needs one or more features that Report Writer does not contain. Any such features can be hand-coded using a **declarative** section, as will be shown later in the chapter.

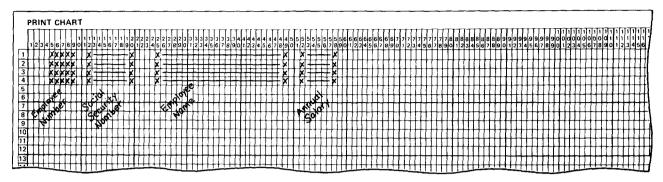

The Report Section and Report Groups

The first program we will write using Report Writer reads cards and prints the contents of each one, reformatted, on one line. There are no page or column headings. The input format for this program is shown in Figure 1.1, and the output format in Figure 1.2.

Figure 1.1 Input format for Program 38.

Figure 1.2 Output format for Program 38.

Program 38 is shown in Figure 1.3. In the Data Division we see the **Report Section**, beginning at line 00490. The Report Section must appear whenever Report Writer is used, and it must be the last section in the Data Division. In the File Section, the ouput file FD entry, line 00420, has no level-01 entry associated with it. Instead, the **REPORT IS** clause in the FD entry tells COBOL that Report Writer will be writing out a report on this file. The REPORT IS clause gives a name to the report that is being produced. In this program the **report name** is EM-PLOYEE-REPORT. The rules for making up report names are the same as for making up file names.

Figure 1.3 Program 38.

Every report name given in the File Section must appear in the Report Section as part of an RD entry (report description entry). Within the RD entry and the level numbers that follow it, many characteristics of the report are described. Report Writer uses these descriptions of the report to create the necessary coding.

Each level-01 entry following the RD entry describes a different type of line, or a group of related lines, that may appear on the report. The line or lines appearing under a level-01 entry is called a **report group**. In Program 38, the level-01 entry, shown in line 00520, describes a report group called REPORT-LINE. In this case, the report group consists of only one line. The rules for making up report group names are the same as for making up data names.

The report group REPORT-LINE is shown as TYPE DETAIL, meaning that this is a detail line on the report. Some other TYPEs of report groups that may be described are:

- a. REPORT HEADING, one or more lines to print only once on the report at the
- b. PAGE HEADING, one or more lines to print at the top of every page
- c. CONTROL FOOTING, one or more lines to print after a control break has been detected
- d. PAGE FOOTING, one or more lines to print at the bottom of each page before skipping to a new page
- REPORT FOOTING, one or more lines to print at the end of the report

The clause LINE PLUS 1, at line 00540, tells Report Writer that the detail lines on this report are to be single-spaced. The clause LINE PLUS 1 means that each detail line is to be printed on whatever LINE the previous one was printed, PLUS 1. One way or another, you must always explicitly tell Report Writer where to put every line it prints.

We come now to the level-05 entries, beginning with line 00550, where we describe the individual fields that make up REPORT-LINE. Using the COLUMN clause, we tell Report Writer the print position where each field on the line begins. The column numbers shown in these COLUMN clauses were taken directly from the print spacing chart in Figure 1.2. There is no need for FILLER entries or for counting the number of blanks between fields.

The SOURCE clause tells Report Writer where the data come from in the Data Division to fill each field. The SOURCE of a print field may be any identifier anywhere in the File Section or Working Storage Section or certain fields in the Report Section.

The Procedure Division introduces three new verbs. The INITIATE statement, line 00730, must be issued to initialize the report file. It must be issued after the output file has been OPENed in the usual way and before a GENERATE verb is issued for that report. The INITIATE statement must include the report name as it appears in the RD entry. The GENERATE verb may be used to print a report group. In this case we have only the one report group REPORT-LINE. The statement GENERATE REPORT-LINE, at line 00770, does everything: It blanks the output areas that should be blank, moves data from the input area to the print line, single-spaces the paper, and writes a line.

After the complete report is written, a TERMINATE statement must be issued for the report name, as shown in line 00810. This must be done before the file is CLOSEd. Program 38 was run with the input data shown in Figure 1.4 and produced the output shown in Figure 1.5.

EXERCISE 1

Using Report Writer, write a program to read and process a deck of input cards in the format shown in Figure 1.E1.1. Have your program print the contents of each card on one line in the format shown in Figure 1.E1.2.

Figure 1.E1.1 Input format for Exercise 1.

Figure 1.E1.2 Output format for Exercise 1.

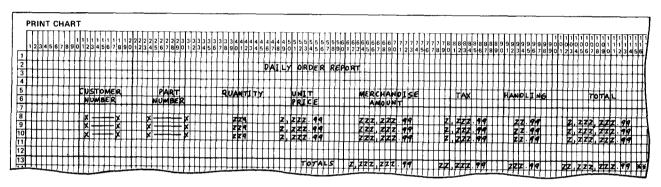

A Final Total Using Report Writer

We will now do a program that shows how Report Writer handles page and column headings, arithmetic manipulation of data before they are printed on a detail line, and totaling. Program 39 reads input cards in the format shown in Figure 1.6. Each input card record represents the purchase of some parts by a customer. The record shows the quantity purchased, the price per unit, and a handling charge for the order. The program is to read each card and compute the cost of the merchandise (by multiplying the Quantity by the Unit Price) and a tax at 7 percent of the merchandise amount. Then the program is to add together the merchandise amount, the tax, and the handling charge to arrive at a total for the order. The information for each order is to be printed on one line as shown in Figure 1.7. At the end of the report, the program is to print the total of all the merchandise amounts for all the orders, the totals of all the tax and handling charge amounts, and a grand total of all the order totals, as shown in Figure 1.7. The program is also to print a report title and column headings as shown in Figure 1.7.

Figure 1.6 Input format for Program 39.

Figure 1.7 Output format for Program 39.

In addition, this program and all subsequent programs will allow for the possibility that the input file (or input files, if a program has more than one) contains no data. In our programs such a situation could arise only through error, but in actual practice empty input files can occur in normal operation. Program 39 will handle an empty input file by printing the report title, the column headings, the words "No input data," and a total line with all zero totals. Later you will see how to suppress the printing of column headings and total lines by using declarative sections.

Program 39 is shown in Figure 1.8. The Working Storage Section, beginning on line 00470, contains fields that we will need for the results of arithmetic.

The RD entry, line 00550, has a few clauses that we are seeing for the first time. The CONTROL clause tells Report Writer that FINAL totals are to be printed. In a later program we will see how totals for minor, intermediate, and major control breaks are indicated in the CONTROL clause. The PAGE clause is required if you want to control the vertical spacing of lines on the page. From the print spacing chart in Figure 1.7, you can see that the first detail line of the report is to print on line 8 of the page, and we indicate this to Report Writer by saying FIRST DETAIL 8. We are also required to tell Report Writer how many lines can fit on a page, and here we arbitrarily said 50.

Figure 1.8 Program 39.
