Preface

Over the years of working with undergraduate and graduate students in the physiology of exercise laboratory, I've noticed that theory and practice are not always related in the student's mind. Too often, the scientific method remains an ivory tower concept, never applied. Unfortunately, some coaches base their practices on the methods of a highly successful athlete, whose success may be totally unrelated to the fads used in his or her training. Because of such practices and conditions, I have made an effort to bring theory and practice closer together—adding the *how to* approach while at the same time respecting scientific investigations that provide the *why* for the *how to*.

Physiology of Exercise for Physical Education and Athletics is concerned with human responses and adaptations to muscular activity. The text provides a basis for the study of physical fitness and athletic training. It is written primarily for the upper-division undergraduate student who has a background in basic anatomy and general physiology. A knowledge of physics, chemistry, or mathematics beyond the high school level is not necessary. In addition, those who aspire to be athletic coaches will find within these pages the scientific basis for their profession. Since emphasis is placed upon the holes in our patchwork quilt of knowledge and since a substantially updated and expanded bibliography is provided at the end of each chapter, the text can also assist the graduate student who wishes to chip away at the frontiers of knowledge in this discipline. Those who use exercise as a therapeutic modality will also find guiding principles in this text.

Ever since the first edition this textbook has been divided into three parts, because I realize that students enter this field with greatly

diverse backgrounds in the basic sciences. Thus, Part 1 selectively reviews the most pertinent areas of basic physiology. In classes where the students' background in general physiology is strong, the instructor can emphasize applications that are presented in Parts 2 and 3. We have maintained this organization because of its basic pedagogic soundness and its obvious advantages where homogeneity of lower-division preparation is not common.

In the third edition a clearer division and better definition of the second and third parts was possible. In the years since the second edition, it had become clear that physical fitness can contribute substantially to lifelong good health. The body of evidence that was previously only suggestive had rapidly become compelling. Therefore, the text was reorganized to recognize that the study of exercise physiology has two major interests for the physical educator. The first is the enhancement of health and physical fitness for the general population, and the second is optimization of performance in the various types and levels of competitive athletics. Thus, the third and fourth editions were organized quite naturally into three parts. The first deals with the basic physiology that provides the groundwork for application to our field. Although this is organized on a systemic basis, the potential applications are pointed out and emphasized. Recognizing the basic differences in interest between those who are primarily teachers of health and physical education and those whose future lies largely in the coaching of athletics, the second section deals with the physiology of exercise directed toward health and fitness, while the third section is devoted to the scientific improvement of athletic performance.

9137-73/05

The foregoing is how I introduced the fourth edition of this text. I now have a much more important introduction to make. I have prevailed upon Dr. Terry J. Housh to join me in writing this fifth edition. It is with great pleasure and satisfaction that I welcome Dr. Housh to the rewarding task of communicating the body of knowledge in exercise physiology to the new generations of physical education teachers and coaches. He is, at a

young age, already Director of the Human Performance Laboratory at the University of Nebraska-Lincoln. He has achieved eminence in our field and has had wide experience with both undergraduate and graduate students who are impressed with his enthusiasm as well as his erudition. Those who are familiar with the earlier editions will readily recognize the improvement that our collaboration has brought about in this fifth edition.

Herbert A. deVries
Laguna Beach, California

In the fifth edition we have added three new chapters. In the first section we have included a chapter (chap. 11) titled "The Immune System and Exercise." Anecdotal evidence suggests that exercise enhances an individual's resistance to infection, but coaches are often concerned about an increased number of infectious episodes particularly near the end of the competitive season. These conflicting testimonials indicate a need to discuss such important questions as: 1) the effect of acute and chronic exercise upon immune function; 2) the relationship of intensity, duration, and frequency of exercise and immune function; and 3) what clinical implications result from the foregoing relationships?

In the second section we have added a chapter (chap. 18) titled "Growth, Development, and Exercise in Children and Adolescents." The interest and participation of children and adolescents in recreational and competitive sports has increased dramatically in recent years. Therefore, professionals in our field must be knowledgeable in the areas of normal growth and development as well as the effects of exercise on young competitors. Chapter 18 attempts to satisfy this need.

In the world of physical education and

most especially in the realm of athletic performance, we are constantly involved directly or indirectly with the concept of fatigue. In all events in which time or distance are criteria of success, we are of necessity concerned with an endpoint largely determined by this entity we call "fatigue." Since neuromuscular fatigue is so basic to performance we have added a new chapter (chap. 20) on this subject to the second section of the text.

The fifth edition contains many new and updated figures. In some instances, however, we chose to retain classic figures from older references. When communication could be improved, existing figures from the fourth edition were modified or new figures were added. However, when updating figures from more recent citations did not add to the clarity of presentation, we chose to retain the well established figures from the past. We believe that the primary responsibility of this text is to communicate, in the best possible way, with students who are studying to become physical educators, coaches, and exercise scientists. Part of our commitment to those students is to maintain a link with the rich heritage of exercise physiology, while also providing the most up-to-date information available. One way to

provide an understanding of the chronology of developments in exercise physiology is to include the classic works in the area along with the most modern citations and utilize some of the excellent diagrams and figures from the pioneer scientists in our discipline.

We are grateful to the hundreds of scientists around the world who have made this text possible. While it is not possible to acknowledge every contributor to this work we would like to recognize the following scientists who have been influential in the course of our

professional lives: Martha Coryell, Stroudsburg State University; Roger J. Williams, University of Texas; J. Pat Meehan and Aileene Lockhart at University of Southern California; Glen O. Johnson, University of Nebraska-Lincoln; and William G. Thorland, Washington State University.

We also wish to thank our editors, Chris Rogers and Scott Spoolman of Brown & Benchmark Publishers, for their generous support.

Contents

Preface xv

part 1

Basic Physiology Underlying the Study of Physiology of Exercise 1

1 The Why of Physiology of Exercise 3

Why Physical Fitness? 4
Improving Human Athletic Performance 4
Professionalism in Physical Education and Athletics 5
"Get Some Exercise" 6
Gender and Age Differences in Response to Training 6
Scientific Method 7
Overview of Text 8

2 Structure of Muscle Tissue 10

Gross Structure of Skeletal Muscle 11
Microscopic Structure of Skeletal Muscle 11
Structure of the Muscle Cell or Fiber 12
Muscle Fiber Types 15
Structure of the Myofibril and the Contractile Mechanism 17
Blood Supply and Lymphatics 23
Nerve Supply 23

3 Energetics of Muscular Contraction and Adaptations to Training at the Cellular Level 28

Energetics of Muscular Contraction 29
Adaptations to Training and Conditioning at the Cellular Level 34
Energy Substrate and Training 39

4 The Physiology of Muscle Contraction 46

Physiology of Gross Muscle Contraction 47
Electromyography in Analysis of Muscle Function 56

5 The Nervous System and Coordination of Muscular Activity 68

- The Neuron and the Motor Unit 69
- The Reflex Arc and Involuntary Movement 70
- Intersegmental and Suprasegmental Reflexes 71
- Proprioception and Kinesthesia 72
- The Alpha and Gamma Systems for Muscular Control 78
- Higher Nerve Centers and Muscular Control 82
- Posture, Balance, and Voluntary Movement 84
- Perception of Effort 85
- Use-Disuse Phenomena in the Nervous System 85
- Does Viscerosomatic Motor Inhibition Limit Exercise? 86
- Practical Considerations 86

6 The Heart and Exercise 93

- Review of the Cardiac Cycle 94
- The Cardiac Output 95
- Coronary Circulation and Efficiency of the Heart 103
- Factors Affecting the Heart Rate 105
- The Heart Rate during and after Exercise 106
- Effects of Athletic Training on the Heart 109
- Training Effects at the Cellular Level 109
- The Cardiac Reserve Capacity 110
- Heart Murmurs 110

7 The Circulatory System and Exercise 115

- Hemodynamics: Principles Governing Blood Flow 116
- The Microcirculation: Blood Flow through the Capillary Bed 118
- Control of Blood Distribution 120
- Blood Distribution in Rest and Exercise 121
- Blood Pressure 122
- Arterial Blood Pressure during Exercise 125
- Blood Flow in Exercising Muscles 126
- Blood and Fluid Changes during Exercise 129
- Blood and Fluid Changes from Training 129

8 The Lungs and External Respiration 136

- Anatomy of External Respiration 137
- Mechanics of Lung Ventilation 137
- Nomenclature for the Lung Volumes and Capacities 139
- Respiratory Control 139

Importance of Breathing Pattern 142
Efficiency of Breathing 145
Improving Performance by Better Breathing 146
Training Effects on Pulmonary Function 146
Respiratory Phenomena 147
Unusual Respiratory Maneuvers 148
Effects of Air Pollution on Respiration 150
Smoking—Self-Induced Air Pollution 151

9 Gas Transport and Internal Respiration 156

Properties of Gases and Liquids 157
Gas Transport by the Blood 159
Internal Respiration 160
Regulation of Acid-Base Balance 162
Acid-Base Balance as a Factor Limiting Performance 165
Changes in Lung Diffusion in Exercise 165
Use of Oxygen to Improve Performance 166
What Sets the Limits of Aerobic Power? 167

10 The Endocrine System and Exercise 172

Nature of Hormones 173
Importance of Hormones in Exercise and Sports 175
Endocrine Effects on Performance-Related Parameters 176
Pituitary-Adrenocortical Axis and Stress Theory 177
Effect of Exercise on Endocrine Function 180

11 The Immune System and Exercise 192

The Immune System 193
Nonspecific Immune Mechanisms 193
Specific Immune Mechanisms 196
The Effects of Exercise and Immune Function 199
Clinical Implications of Exercise and Immune Function 202

12 Exercise Metabolism 207

Definition of Terms 208
Methods for Standardizing and Measuring Exercise Loads 210
Methods for Measuring Energy Consumption 214
Oxygen Deficit and Recovery Oxygen 216
New Concepts Concerning Recovery Oxygen 218

Training Effect on Anaerobic Metabolism and Recovery
Oxygen 221
Intermittent Work (Interval Training) 221
Maximal O₂ Consumption as a Measure of Physical Fitness 222
Respiratory Quotient 223
The Anaerobic Threshold Controversy 224
Theoretical Problems with the Anaerobic Threshold Concept 225
Negative Work 226

part 2

Physiology Applied to Health and Fitness 233

13 Health Benefits: Prophylactic and Therapeutic Effects of Exercise 235

Physical Activity, Physical Fitness, and All-Cause Mortality 236
The Cardiovascular System and Exercise 237
Lipid Metabolism and Exercise 241
Pulmonary Function Effects 242
Oxygen Transport Effects 242
Effects on Bones, Joints, and Connective Tissue 242
Effects of Exercise on Cancer 243
The "Tranquilizer Effect" 244
Effect of Exercise on Psychiatric State 245

14 Physical Fitness Testing 252

Measurement of Physical Working Capacity (PWC) by Maximum O₂ Consumption 254
Estimation of PWC from Heart Rate at Submaximal Loads 260
Measurement of Anaerobic Capabilities 273
New Concepts in Measuring Physical Fitness 275
Motor Fitness Tests 280
The New AAHPERD Health Related Physical Fitness Test 282
Physical Fitness Evaluation as a Function of Age Groups 282

15 Physical Conditioning for Health and Fitness (Prescription of Exercise) 287

Principles Involved in Scientific Prescription of Exercise 289
Need for Medical Evaluation and Exercise Testing Prior to Participation in Endurance Exercise 289
Training Curves 292

- Interval Training versus Continuous Exercise 292
- Recommendations of the American College of Sports Medicine (ACSM) for Developing Cardiorespiratory Fitness in Healthy Adults 293
- Mode of Exercise (ACSM Recommendation: Aerobic in Nature) 293
- Intensity of Exercise 295
- Duration of Exercise (ACSM Recommendation: Twenty to Sixty Minutes of Continuous Aerobic Exercise) 297
- Frequency of Exercise (ACSM Recommendation: Three to Five Days per Week) 300
- Exercise Prescription 301
- Effects of Gender and Age on Training Adaptations 305
- Specificity of Training 305
- Potential Physiological Changes Resulting from Training 305
- Training as a Stressor 306
