Preface

This text on managerial economics contains: (1) expositions of theoretical and analytical tools of economics that are useful in managerial decision making; (2) reviews of empirical studies and illustrations of applications of the managerial economics concepts; (3) many short problems and a number of cases involving managerial situations that call for economic analysis; (4) lists of articles in professional journals that are recommended for further reading.

The book reflects several guidelines developed by the author of the first two editions: (1) The exposition of theoretical ideas should flow from simple to complex with considerable repetition of the basic concepts; (2) Each presentation of theoretical analysis should be immediately followed by practical applications to demonstrate relevance and help bridge the gap between theory and practice; (3) An abundance of problems and cases should be provided to let students test their understanding of theoretical concepts and develop the judgment skills required in applications of managerial economics; (4) There should be enough institutional, psychological, and sociological material to give students practice in coping with the influences of complex and shifting environments upon decision processes; (5) The underlying analytical structure from economics should be carefully related to concepts from accounting, finance, production, marketing, personnel, and business policy to help students integrate their professional knowledge.

In preparing this fourth edition, I have been aware that many students add the text to their permanent professional libraries. I have tried to provide adequate expositions over a wide range of topics, so that the book will be satisfactory for future use as a reference by practicing managers and staff economists.

Quantitative approaches to managerial economic analysis have been given a little more emphasis than in earlier editions. However, the assumed mathematical and statistical preparation of students is at the sophomore and junior level. Teachers can easily increase or decrease the

quantitative emphasis to suit needs and abilities of particular classes and individual students.

Users of earlier editions will find (in Chapters 6 through 10) a completely reorganized and more carefully developed treatment of the following topics: resource allocation, cost minimization, cost estimation, cost and profitability analysis for continuative production, and cost and profitability analysis for discrete runs of production. Although the remainder of the text is much like the corresponding material in the third edition, close readers will find many small changes. One (not so small) change that deserves attention here is the integration of decision tree analysis. A simple decision tree is explained (in connection with decisions about new products) in Chapter 10. A risk-adjusted tree is discussed (in relation to pricing decisions in oligopoly firms) in Chapter 11. And a sequential decision tree with discounted payoffs is described (in a capital budgeting application) in Chapter 14.

I am very grateful to the following persons:

Louis Ederington of Georgia State University for collaboration in re-writing Chapter 10 (Profitability Analysis: Discrete Runs of Production) and Larry Schroeder of Syracuse University for his help in revising Chapter 4 (Business Conditions Analysis), Chapter 5 (Short-Range Forecasting), and Chapter 15 (Cost Effectiveness and Benefit-Cost Analyses);

Bruce Allen of Michigan State University, Ann Fisher of State University of New York College at Fredonia, and John Crockett of the University of Houston for the large number of constructive suggestions resulting from their close reviews of the manuscript, and copy editor Carol Reitz for her assistance with this edition.

Dean Kenneth Black, Jr. of the College of Business Administration at Georgia State University for urging me to make the book my best effort and giving me a full measure of support in the project.

I shall be grateful for suggestions for improving the fifth edition from teachers and students who use this book.

March 1978

WILLIAM R. HENRY

Contents

PART ONE

INTRODUCTION TO MANAGERIAL ECONOMICS

1. The scope and method of managerial economics	3
Relation to other branches of learning, 4	
Profits: A central concept, 7	
Behavioral theory of the firm, 11	
Models and suboptimization, 12	
Organization of this book, 14	
The usefulness of managerial economics, 15	
2. Five fundamental concepts	18
Incremental reasoning, 18	
Opportunity cost, 23	
Contribution, 29	
Time perspective on costs and revenues, 33	
Time value of money, 34	
Some important applications, 37	
<i>Cases for part one</i>	44

PART TWO

DEMAND ANALYSIS AND SHORT-RANGE FORECASTING

3. Demand analysis	57
Some basic concepts, 57	
Two common demand models, 68	
Market structure, 73	
Other influences on demand elasticities and demand levels, 75	
Psychological and sociological concepts of consumer behavior, 80	

Estimating demand equations, 83	
A study of demand for durable goods, 91	
4. Business conditions analysis	97
Measuring business conditions, 98	
Forecasting without macro models, 101	
Forecasting with macro models, 108	
5. Short-range forecasting	129
Forecasting industry demand and capacity, 129	
Forecasting market demand and the firm's share, 140	
Cases for part two	148
 PART THREE	
RESOURCE ALLOCATION, PRODUCTION ECONOMICS, AND COST ANALYSIS	
6. Resource allocation	167
An overview of production, 167	
Decisions about a single input that has constant marginal productivity, 170	
Allocating an input that has decreasing marginal productivity, 185	
The produce mix problem: Conceptual framework, 196	
An introduction to linear programming, 202	
Sensitivity analysis, 210	
Linear programming and some basic economic concepts, 214	
7. Cost minimization	222
Technical substitutability of inputs, 222	
Economic substitutability of inputs, 227	
Linear programming formulation of least-cost problems, 230	
The expansion path, 240	
Other forms of input substitutability, 244	
Short-run cost functions, 247	
Long-run cost functions, 255	
8. Estimation of production and cost functions	265
The economic-engineering approach, 265	
Statistical estimates of production and cost functions, 277	
Using estimated functions, 292	

PART FOUR**ANALYSIS OF PROFITABILITY OF CHANGES IN OUTPUT****9. Profitability analysis: Continuative production 301**

Classification approach to cost analysis, 301

Accounting costs and economic costs, 308

Break-even charts, 311

Profit-volume analysis, 319

Curvilinear functions, 321

10. Profitability analysis: Discrete production runs 330

Terminating production: Product types (or models) and projects, 330

Intermittent production: Lots, 354

Cases for part four 382**PART FIVE****ANALYSIS OF PRICE AND NONPRICE COMPETITION****11. Price and nonprice competition 407**

An overview of price theory, 407

Theory of pricing with demand taken as given, 409

Theory of deliberate demand shifting, with price taken as given, 415

Oligopoly, 420

Decision tree analysis of an oligopoly firm's marketing
alternatives, 427

Appraisal of several shortcuts in pricing, 434

Incremental reasoning in pricing, 436

The pricing process, 438

12. Selected topics in pricing 454

Price discrimination, 454

Peak-load pricing, 462

Public utility rate regulation, 470

Multiple-product pricing, 476

Transfer pricing, 480

Cases for part five 496**PART SIX****LONG-RANGE PLANNING****13. Long-range forecasting and strategy formulation 539**

Formulation of corporate strategy, 539

Social forecasting, 544

Technological forecasting, 550	
Resource forecasting, 556	
Forecasting joint and derived demands: Input-output analysis, 558	
An example of strategy formulation: Radio Corporation of America, 561	
Some examples of long-range forecasting for nonprofit organizations, 561	
14. Capital budgeting	568
Central role of corporate strategy, 568	
An overview of capital budgeting, 570	
Forecasting cash flow of a project, 571	
Measuring project profitability, 573	
Costs of capital, 579	
Mutually exclusive projects, 583	
Risk adjustments, 585	
Using decision trees in capital planning, 586	
Capital rationing, 592	
Empirical studies, 592	
Cases for part six	598
 PART SEVEN	
APPLICATIONS IN PUBLIC AND NONPROFIT AGENCIES	
15. Cost-effectiveness and benefit-cost analysis	639
Role of the public sector in the economy, 640	
Estimating demands and evaluating benefits, 642	
Production and costs in the public sector, 649	
Prices, charges, and subsidies, 651	
Benefit-cost and cost-effectiveness analyses, 656	
Multiple objectives and group decisions in the public sector, 666	
Cases for part seven	671
Appendix	685
Index of cases	697
Index	699

List of figures

- 1-1 The two worlds of a decision-maker, 14
- 2-1 Annual revenues and expenses, widget production, 25
- 2-2 Expected annual revenues and expenses, gadget production, 25
- 2-3 Incremental revenue, cost, and profit (change to alternative 2), 26
- 2-4 Incremental revenue, cost, and profit (change to alternative 3), 26
- 2-5 Revenue, economic cost, and economic profit (alternative 2), 27
- 2-6 Revenue, economic cost, and economic profit (alternative 3), 27
- 2-7 How discounting affects project profitability, 36
- 3-1 A family of demand curves (hypothetical), 60
- 3-2 Linear demand curve with varying elasticities and the corresponding total revenue curve (hypothetical), 69
- 3-3 Constant elasticity demand curves and their log-linear transformations, 72
- 4-1 Circular flow of national product, 98
- 4-2 Gross National Product, 101
- 4-3 Leading, lagging, and coincident indicators, 102
- 4-4 Condensed flow diagram, 124
- 5-1 Why cement users are getting squeezed, 139
- 6-1 A hypothetical production surface for window cleaning (First case: Constant marginal productivity of labor), 171
- 6-2 Side view of surface, rotated 180°, 172
- 6-3 Optimum use of input with a rising supply price and constant marginal revenue product, 175
- 6-4 Constant marginal products of labor in three activities, 176
- 6-5 Constant marginal revenue products of labor in three activities, 177
- 6-6 Optimum use of input with falling marginal revenue product and a constant supply price, 180
- 6-7 Optimum use of an input with falling marginal revenue product and rising marginal resource cost, 182
- 6-8 Optimum allocation of a limited quantity of an input that has decreasing marginal revenue in multiple uses, 184
- 6-9 A hypothetical production surface for window cleaning (Second case: Decreasing marginal productivity of labor, 186

- 6-10 Side view of surface rotated 180° , 187
- 6-11 Optimum use of an input that has decreasing value of marginal product in a single use, 190
- 6-12 Graphic method of determining equimarginal allocations of limited quantities of an input among uses in which the input's marginal revenue products are decreasing, 194
- 6-13 Production possibility curve (heterogeneous inputs), 198
- 6-14 Production possibility curve (homogeneous inputs), 199
- 6-15 Production possibility curves (superimposed), 200
- 6-16 Isocontribution lines: Two outputs, 201
- 6-17 Optimal combination of two outputs with a given quantity of inputs and a given price of outputs, 202
- 6-18 Feasible region for a simple LP problem, 207
- 6-19 Graphic solution for a simple LP problem, 209
