Rissho University, Yokohama,  
Japan

## Symbols and Units

Symbols and units agree with SI standards (for conversion factors see page IX). The following list gives the most important symbols used in the encyclopedia. Articles with many specific units and symbols have a similar list as front matter.

| Symbol     | Unit                                  | Physical Quantity                                             |
|------------|---------------------------------------|---------------------------------------------------------------|
| $a_B$      |                                       | activity of substance B                                       |
| $A_r$      |                                       | relative atomic mass (atomic weight)                          |
| $A$        | $m^2$                                 | area                                                          |
| $c_B$      | $\text{mol}/m^3$ , $\text{mol}/L$ (M) | concentration of substance B                                  |
| $C$        | C/V                                   | electric capacity                                             |
| $c_p, c_v$ | $J\text{ kg}^{-1}\text{ K}^{-1}$      | specific heat capacity                                        |
| $d$        | cm, m                                 | diameter                                                      |
| $d$        |                                       | relative density ( $\rho/\rho_{\text{water}}$ )               |
| $D$        | $m^2/s$                               | diffusion coefficient                                         |
| $D$        | Gy (= J/kg)                           | absorbed dose                                                 |
| $e$        | C                                     | elementary charge                                             |
| $E$        | J                                     | energy                                                        |
| $E$        | V/m                                   | electric field strength                                       |
| $E$        | V                                     | electromotive force                                           |
| $E_A$      | J                                     | activation energy                                             |
| $f$        |                                       | activity coefficient                                          |
| $F$        | C/mol                                 | Faraday constant                                              |
| $F$        | N                                     | force                                                         |
| $g$        | $m/s^2$                               | acceleration due to gravity                                   |
| $G$        | J                                     | Gibbs free energy                                             |
| $h$        | m                                     | height                                                        |
| $\hbar$    | $\text{W} \cdot s^2$                  | Planck constant                                               |
| $H$        | J                                     | enthalpy                                                      |
| $I$        | A                                     | electric current                                              |
| $I$        | cd                                    | luminous intensity                                            |
| $k$        | (variable)                            | rate constant of a chemical reaction                          |
| $k$        | J/K                                   | Boltzmann constant                                            |
| $K$        | (variable)                            | equilibrium constant                                          |
| $l$        | m                                     | length                                                        |
| $m$        | g, kg, t                              | mass                                                          |
| $M_r$      |                                       | relative molecular mass (molecular weight)                    |
| $n_D^{20}$ |                                       | refractive index (sodium D-line, 20 °C)                       |
| $n$        | mol                                   | amount of substance                                           |
| $N_A$      | $\text{mol}^{-1}$                     | Avogadro constant ( $6.023 \times 10^{23} \text{ mol}^{-1}$ ) |
| $p$        | Pa, bar *                             | pressure                                                      |
| $Q$        | J                                     | quantity of heat                                              |
| $r$        | m                                     | radius                                                        |
| $R$        | $J\text{ K}^{-1}\text{ mol}^{-1}$     | gas constant                                                  |
| $R$        | $\Omega$                              | electric resistance                                           |
| $S$        | J/K                                   | entropy                                                       |
| $t$        | s, min, h, d, month, a                | time                                                          |

Symbols and Units (Continued from p. VII)

| Symbol         | Unit                                   | Physical Quantity                                |
|----------------|----------------------------------------|--------------------------------------------------|
| $t$            | $^{\circ}\text{C}$                     | temperature                                      |
| $T$            | K                                      | absolute temperature                             |
| $u$            | m/s                                    | velocity                                         |
| $U$            | V                                      | electric potential                               |
| $U$            | J                                      | internal energy                                  |
| $V$            | $\text{m}^3$ , L, mL, $\mu\text{L}$    | volume                                           |
| $w$            |                                        | mass fraction                                    |
| $W$            | J                                      | work                                             |
| $x_{\text{B}}$ |                                        | mole fraction of substance B                     |
| $Z$            |                                        | proton number, atomic number                     |
| $\alpha$       |                                        | cubic expansion coefficient                      |
| $\alpha$       | $\text{W m}^{-2}\text{K}^{-1}$         | heat-transfer coefficient (heat-transfer number) |
| $\alpha$       |                                        | degree of dissociation of electrolyte            |
| $[\alpha]$     | $10^{-2}\text{deg cm}^2\text{g}^{-1}$  | specific rotation                                |
| $\eta$         | $\text{Pa} \cdot \text{s}$             | dynamic viscosity                                |
| $\theta$       | $^{\circ}\text{C}$                     | temperature                                      |
| $\kappa$       |                                        | $c_p/c_v$                                        |
| $\lambda$      | $\text{W m}^{-1}\text{K}^{-1}$         | thermal conductivity                             |
| $\lambda$      | nm, m                                  | wavelength                                       |
| $\mu$          |                                        | chemical potential                               |
| $\nu$          | $\text{Hz}$ , $\text{s}^{-1}$          | frequency                                        |
| $\nu$          | $\text{m}^2/\text{s}$                  | kinematic viscosity ( $\eta/\rho$ )              |
| $\pi$          | Pa                                     | osmotic pressure                                 |
| $\rho$         | $\text{g}/\text{cm}^3$                 | density                                          |
| $\sigma$       | N/m                                    | surface tension                                  |
| $\tau$         | $\text{Pa (N/m}^2\text{)}$             | shear stress                                     |
| $\varphi$      |                                        | volume fraction                                  |
| $\chi$         | $\text{Pa}^{-1} (\text{m}^2/\text{N})$ | compressibility                                  |

\* The official unit of pressure is the pascal (Pa).

## Conversion Factors

| SI unit             | Non-SI unit           | From SI to non-SI multiply by      |
|---------------------|-----------------------|------------------------------------|
| <i>Mass</i>         |                       |                                    |
| kg                  | pound (avoirdupois)   | 2.205                              |
| kg                  | ton (long)            | $9.842 \times 10^{-4}$             |
| kg                  | ton (short)           | $1.102 \times 10^{-3}$             |
| <i>Volume</i>       |                       |                                    |
| m <sup>3</sup>      | cubic inch            | $6.102 \times 10^4$                |
| m <sup>3</sup>      | cubic foot            | 35.315                             |

## Powers of Ten

|           |           |           |            |
|-----------|-----------|-----------|------------|
| E (exa)   | $10^{18}$ | d (deci)  | $10^{-1}$  |
| P (peta)  | $10^{15}$ | c (centi) | $10^{-2}$  |
| T (tera)  | $10^{12}$ | m (milli) | $10^{-3}$  |
| G (giga)  | $10^9$    | μ (micro) | $10^{-6}$  |
| M (mega)  | $10^6$    | n (nano)  | $10^{-9}$  |
| k (kilo)  | $10^3$    | p (pico)  | $10^{-12}$ |
| h (hecto) | $10^2$    | f (femto) | $10^{-15}$ |
| da (deca) | 10        | a (atto)  | $10^{-18}$ |

## Abbreviations

The following is a list of the abbreviations used in the text. Common terms, the names of publications and institutions, and legal agreements are included along with their full identities. Other abbreviations will be defined wherever they first occur in an article. For further abbreviations, see page VII, Symbols and Units; page XIV, Frequently Cited Companies (Abbreviations), and page XV, Country Codes in patent references. The names of periodical publications are abbreviated exactly as done by Chemical Abstracts Service.

|       |                                                                                                                                                                                                                                             |           |                                                                                                                                                 |

| $v_p$ | peripheral component of velocity |

## 1. Introduction

Air classification is a process for the dry separation of a disperse phase according to particle size, particle shape or density, or more precisely, settling rate. It is the analogue of hydraulic classification in wet-processing technology (→ Elutriation). The bulk material to be separated is introduced into a gas flow, and the particles are subjected primarily to two forces: (1) the resistance or drag force caused by the gas flowing around the particle, and (2) the mass force. The mass forces acting on the particle can be field forces (e.g., gravity) or inertial forces (e.g., centrifugal force). Depending on magnitude and direction of these forces, particles move along different trajectories and can thus be collected separately after leaving the classification zone.

Air classifiers are used partly as sorters but primarily as classifiers. In sorting, a heterogeneous bulk is separated into components of uniform material. The particles are separated ac-
