BIOPOLYMERS: REUSE, RECYCLING, AND DISPOSAL

Plastics Design Library

PLASTICS DESIGN LIBRARY (PDL)

PDL HANDBOOK SERIES

Series Editor: Sina Ebnesajjad, PhD

President, FluoroConsultants Group, LLC

Chadds Ford, PA, USA

www.FluoroConsultants.com

The **PDL Handbook Series** is aimed at a wide range of engineers and other professionals working in the plastics industry, and related sectors using plastics and adhesives.

PDL is a series of data books, reference works and practical guides covering plastics engineering, applications, processing, and manufacturing, and applied aspects of polymer science, elastomers and adhesives.

Recent titles in the series

Brandu, Stretch Blow Molding, Second Edition (ISBN: 9781437735277)

Chandrasekaran, Rubber Seals for Fluid and Hydraulic Systems (ISBN: 9780815520757)

Ebnesajjad, Handbook of Adhesives and Surface Preparation (ISBN: 9781437744613)

Grot, Fluorinated Ionomers, Second Edition (ISBN: 9781437744576)

Kutz, Applied Plastics Engineering Handbook (ISBN: 9781437735147)

More will I tell thee too: there is no birth
Of all things mortal, nor end in ruinous death;
But mingling only and interchange of mixed
There is, and birth is but its name with men.

Empedocles

From William Ellery Leonard's *The Fragments of Empedocles* (Chicago: The Open Court Publishing Company, 1908).

An outline of certain chapters of this book was presented at the Annual Symposium of Biopolymers, held in Denver, 8-10 October 2010, under the title: Disposal, Recycling and Reuse of Biopolymers - The patent perspective.

The expression biopolymer or bioplastic is used to describe two different terms at the same time, which often leads to confusion. It can mean that the polymer or plastic is biodegradable or that the raw material used is renewable or bio-based. According to the first definition a biodegradable polymer derived from fossil fuel resources is considered as biopolymer. The same applies for a non degradable bio-based polymer; for more details see Chapter 2.

The scope of this book is to present and investigate a novel phenomenon related to the recycling and/or disposal of biopolymers. At first, the idea of recycling these polymers is contradicting with the nature and scope of biodegradable biopolymers. As the current interest of biopolymers is largely based on their biodegradability, to consider recycling these polymers is to ignore one of its most important properties. However, there are good reasons for the recycling of biopolymers. Most commercial biopolymers, such as polylactide (PLA), are not degraded under ordinary conditions even in presence of microorganisms. Furthermore, the disposal of biopolymer articles has the disadvantage of discarding valuable raw materials, which could be efficiently reutilized.

Currently, biopolymers lack economies of scale, representing still a small niche within the overall plastics industry, making up less than 1% of the global plastic market, while their waste streams are small and scattered. Surprisingly enough, there is much activity in patenting on the waste treatment of biopolymers, especially from Japanese universities, institutions and companies. All these patent applicants are poised to benefit from the continuous growth of biopolymers when these materials mature and reach a critical mass, which is necessary for recycling to become profitable.

Not much attention has been paid to the waste management of these materials so far. Meanwhile,

biodegradable biopolymers such as polylactide (PLA) are a serious problem when and where they enter either conventional plastics recycling (e.g. of PET) or green-waste composting streams. This problem is expected to grow as biodegradable biopolymers proliferate in residential areas. With the current rate of growth, it is expected that waste issues concerning biopolymers will emerge in the future similarly to the situation of conventional polymers that are currently used.

The book consists of 10 chapters.

Chapter 1 starts with a presentation of the main motivations for using biopolymers. A large section gives an extensive introduction to most of the existing and newly developed biopolymers and provides updated lists of their commercial products and current applications. The following section investigates the possible sources of biopolymers, including first, second and third generation feedstocks. A separate section is dedicated to the sources of scrap and waste biopolymers, which are intended for recycling.

Chapter 2 clarifies and explains the various terms used to describe biopolymers. A separate section presents the positions of the advocates of bioplastics and oxodegradable polymers and the arguments of each group against the other. In the following section are described the main types and mechanisms of (bio) degradation. The last section reviews the tests methods which have been developed for biodegradable including field tests, simulation tests and laboratory tests.

Chapter 3 describes all the possible ways of reusing discarded biopolymers. A distinction is made between reuse and physical recycling (see Chapter 5).

Chapter 4 examines all the known techniques for the disposal of biopolymers, including landfilling, disposal in soil or water and composting (industrial or home). A separated section summarizes the various microbes (aerobic and anaerobic) and enzymes used for the biodegradation of biopolymers. The following section examines alternative waste disposal systems. The last section describes the

destructive thermal methods such as incineration (combustion) and pyrolysis.

Chapter 5 examines the various methods for the physical or mechanical recycling of biopolymers including techniques for identifying and sorting materials by polymer type. A separate section reviews the various marker systems including the Resin Identification Codes (RIC) and fluorescent additives.

Chapter 6 examines the various methods for the chemical recycling of biopolymers including hydrolysis/alcoholysis, dry heat depolymerization, hydrothermal depolymerization, and the relatively new enzymatic depolymerization technique.

Chapter 7 examines the various techniques of modifying and/or controlling the degradation rate of biopolymers, by suppressing or accelerating the degradation speed at will.

Chapter 8 analyzes and correlates trends in patenting related to the waste management of biopolymers. The methodology includes the collection of statistical data all over the world for the period from 01.01.1990 to 31.08.2012. A separate section presents the prospects and limitations of the main waste treatment options for biopolymers. The next section summarizes the current state of patents in the prior art. The last section reviews the developments of new waste treatment processes and biopolymers.

Chapter 9 presents the regulatory framework of biopolymers by grouping all the international standards related to recycling, disposal, biodegradation (aerobic and anaerobic), composting, and ecotoxicity. A separate group of standards refers to the determination of bio-based content. Other groups of standards refer to Life-Cycle-Assessment (LCA) and eco-labeling. A separate section describes the process of certification.

Chapter 10 constitutes of three parts. The first part reviews the few available economic analyses on the disposal and recycling of waste biopolymers. The second part presents life cycle assessment (LCA) analyses of the main biopolymers, i.e., starch, PLA and polyhydroxyalkanoates (PHAs). The third part examines the possible environmental and health effects resulting from the production, use and waste treatment of biopolymers.

The Appendix contains three tables: Table 1 is a collection of the bibliographic data of all patents related to recycling, reuse or disposal of biopolymers. Table 2 is a collection of the bibliographic data of the patents related to biodegradation on demand.

Table 3 is a collection of the bibliographic data of the supplementary patents, which do not refer necessarily to biopolymers, and are used as references to processes and/or materials mentioned in the text.

This book is unique in its coverage encompassing scientific publications as well as patents. Emphasis has been given to patents, since patents refer predominantly to industrial applications and have a potential economic value. Patents, although they represent a substantial part of literature, till recently they were underrepresented in the cited bibliography. Patents are innovative, have an industrial applicability and they are not self-repeated. Although they are not peer reviewed, they have been searched and examined. Most of them come from major industries and international laboratories and the reason for this is possibly the high costs in obtaining and maintaining a patent.

It has to be clarified that the book is not a mere “list” of patents, but rather a critical review of all the available technologies on the issue of the waste management of biopolymers. A patent application is drafted on the so-called “problem-solution” approach; this means that a would-be inventor drafts its patent application by outlining the shortcomings of the prior art and proposing solutions to the stated problem. By summarizing and analyzing all the critical comments of several inventors/applicants on every prior art of each technology, the author was able to build up a clear opinion on the benefits and weaknesses of each technology. Although all this information is indeed available online, it is the author’s opinion that is almost impossible for a would-be researcher to retrieve all the available patent literature by simple searching techniques, without prior expertise. At least for the issue of disposal and recycling of biopolymers most of the available patent literature is in Japanese with only a short abstract in English. On the basis of the abstract, an English speaker may consult online a machine translation of the text, which is a very tedious and not always reliable procedure. Furthermore, the relevant literature is scattered in many technical fields making the retrieval and/or combination of all available information difficult.

The book tries to be neutral on several issues surrounding the use of biopolymers and their recycling, reuse or disposal and to present all different arguments (pros and cons). In this context ground is given to both fighting “camps” in the field of degradable polymers, bioplastics and oxodegradable

polymers, to present their position. Furthermore, the book keeps a critical eye on unjustified claims of properties which cannot and have not yet been validated or the false use of the term bioplastic or biopolymer for marketing purposes. In the same context, it is noted that there are not enough full scale assessments (LCAs) of biopolymers so far. Therefore, biopolymers have still a long way to go to convince the scientific community and the public that they can form a reliable alternative of polymers or plastics derived from fossil fuel resources.

Several of the commercial products mentioned in the manuscript and the accompanying tables are not anymore available in the market (obsolete). However, since these products are used to exemplify certain aspects of the cited patents, they were kept in the text.

The recycling of natural rubber, the most well known biopolymer, has already been analyzed and reviewed extensively in the past, and will not form part of this book.

One of the most striking results of this survey is the excessively large number of Japanese patent applications related to the waste treatment of biodegradable biopolymers. Actually, Japan has the highest number of patent applications worldwide relating to the waste treatment of biopolymers (66% of all patents). In spite of the large number of patents owned by Japanese companies, only two non-Japanese companies are actively involved on a large scale with the recycling of biopolymers or bioplastics; namely NatureWorks in the USA and

Galactic S.A in Europe. However, in view of the large number of patent applications on the recycling of biopolymers future commercial implementation would be expected.

To the best of the author's knowledge there are no books with a similar subject in the market. Useful books, but with a different scope and partial coverage, are the following:

-Handbook of Biodegradable Polymers Handbook of Biodegradable Polymers, 2005, Bastioli, C. (Ed), Smithers Rapra Technology, ISBN: 1859573894.

-Engineering Biopolymers - Markets, Manufacturing, Properties and Applications, 2011, Endres H. J., Siebert-Raths A., Hanser Publications, ISBN: 9781569904619.

-Biodegradable Plastics and Polymers, NIIR board, ISBN: 8178330350.

-Bioplastics In The Waste Stream (CD, online), 2012, iSmithers Rapra Publishing, 2012, ISBN: 9781847359452.

My sincere appreciation goes to Frank Hellwig, Associate Acquisitions Editor and Sina Ebnesajjad, Series Editor of the Plastics Design Library of Elsevier for their continuous support and commitment throughout all stages of production of this book.

Abbreviations of Biopolymers

β -PPL	poly(β -propiolactone)	PBT	poly(butylene carbonate)
β -PBL	poly(β -butyrolactone)	PBP	poly(butylene pimelate)
γ -PGA	poly(γ -glutamic acid)	PBS	poly(butylene succinate); see also poly(tetramethylene succinate) (PTeMS); (different CAS)
ϵ -PL	poly(ϵ -lysine)		
CA	cellulose acetate		
CAB	cellulose acetate butyrate	PBSA	poly(butylene succinate- <i>co</i> -adipate)
CAP	cellulose acetate propionate	PBSC	poly(butylene succinate- <i>co</i> -carbonate)
CN	cellulose nitrate	PBSE	poly(butylene sebacate)
P2HB	poly(2-hydroxybutyrate)	PBSL	poly(butylene succinate- <i>co</i> -lactide)
P3HB	poly(3-hydroxybutyrate) (or PHB)	PBST	poly(butylene succinate- <i>co</i> -terephthalate)
P3HB4HB	poly(3-hydroxybutyrate- <i>co</i> -4-hydroxybutyrate)	PCHC	poly(cyclohexene carbonate)
P3HD	poly(3-hydroxydecanoate) (or PHD)	PCL	poly(ϵ -caprolactone)
P3HN	poly(3-hydroxynonanoate) (or PHN)	PDLA	poly(D-lactide)
P3HP	poly(3-hydroxypropionate)	PDLLA	poly(D,L-lactide)
P4HB	poly(4-hydroxybutyrate)	PDLGA	poly(D,L-lactide- <i>co</i> -glycolide)
P4HB2HB	poly-(4hydroxybutyrate- <i>co</i> -2-hydroxybutyrate)	PDO	polydioxanone (or PDS)
P4HP	poly(-4-hydroxypropionate)	PE	polyethylene (biobased)
P4HV	poly(4-hydroxyvalerate)	PEA	poly(ethylene adipate)
P5HV	poly(5-hydroxyvalerate)	PEAM	poly(ester amide)
P6HH	poly(6-hydroxyhexanoate)	PEAz	poly(ethylene azelate)
PA 1010	polyamide 1010	PEC	poly(ethylene carbonate)
PA 1012	polyamide 1012	PEDe	poly(ethylene decamethylate)
PA 11	polyamide 11	PEF	poly(ethylene furanoate)
PA 410	polyamide 410	PEOx	poly(ethylene oxalate)
PA 610	polyamide 610	PES	poly(ethylene succinate)
PBA	poly(butylene adipate)	PESA	poly(ethylene succinate- <i>co</i> -adipate)
PBAT	poly(butylene adipate- <i>co</i> -terephthalate)	PESE	poly(ethylene sebacate)

PEST	poly(ethylene succinate-terephthalate)	PLLGA	poly(L-lactide- <i>co</i> -glycolide)
PESu	poly(ethylene suberate)	α -PMA	α -type polymalic acid, polymalate
PET	poly(ethylene terephthalate) (biobased)	POE I	poly(ortho ester) I
PEUU	poly(ester urethane urea) (biodegradable)	POE II	poly(ortho ester) II
PGA	polyglycolide, poly(glycolic acid)	POE III	poly(ortho ester) III
PGCL	poly(glycolide- <i>co</i> -caprolactone)	POE IV	poly(ortho ester) IV
PHA	polyhydroxyalkanoate	PPA	polyphthalamide
PHB	polyhydroxybutyrate (or P3HB)	PPHOS	polyphosphazene
PHBHD	poly(3-hydroxybutyrate- <i>co</i> -3-hydroxydecanoate)	PPF	poly(propylene fumarate)
PHBHP	poly(3-hydroxybutyrate- <i>co</i> -3-hydroxypropionate)	PPL	poly(β -propiolactone)
PHBHx	poly(3-hydroxybutyrate- <i>co</i> -3-hydroxyhexanoate) or poly(hydroxybutyrate- <i>co</i> -hydroxyhexanoate)	PPS	poly(propylene succinate)
PHBO	poly(3-hydroxybutyrate- <i>co</i> -3-hydroxyoctanoate) (or P3HB/3HO)	PPT	poly(propylene terephthalate) (biobased); see also PTT
PHBHV	poly(3-hydroxybutyrate- <i>co</i> -3-hydroxyvalerate)	PTeMAT	poly(tetramethylene adipate- <i>co</i> -terephthalate); see also poly(butylene adipate- <i>co</i> -terephthalate (PBST).
PHD	polyhydroxydecanoate (or P3HD)	PTeMC	poly(tetramethylene carbonate)
PHHp	poly(3-hydroxyheptanoate)	PTMC	poly(trimethylene carbonate)
PHHx	poly(3-hydroxyhexanoate)	PTeMS/ PTeMC	poly[(tetramethylene succinate)- <i>co</i> -(tetramethylene carbonate)]
PHN	polyhydroxynonanoate (or P3HN)	PTMA	poly(trimethylene adipate)
PHO	poly(3-hydroxyoctanoate)	PTMAT	poly(methylene adipate- <i>co</i> -terephthalate)
PHP	poly(3-hydroxypropionate) (or P3HP)	PTeMA	poly(tetramethylene adipate)
PHSE	poly(hexamethylene sebacate)	PTMG	poly(tetramethyl glycolide)
PHV	poly(3-hydroxyvalerate)	PTeMS	poly(tetramethylene succinate); see also poly(butylene succinate) (PBS) (different CAS)
PLA	polylactide, poly(lactic acid)	PTT	poly(trimethylene terephthalate) (biobased); see also PPT
PLCL	poly(lactide- <i>co</i> -caprolactone)	PU	polyurethane (biobased)

9.1.6 Terminology	268
9.1.7 Life Cycle Assessment (LCA) Related Standards	268
9.1.8 Eco-Labeling	271
9.2 Certification	271
9.2.1 Certification Systems.....	272
References.....	274
10 Economic Evaluation and Environmental Impacts	275
10.1 Economic Evaluation.....	275
10.2 Life Cycle Assessment (LCA)	277
10.2.1 LCA of Biopolymers.....	279
10.3 Environmental Impacts.....	285
10.3.1 Litter and Pollution of Environment.....	285
10.3.2 Source of Feedstocks.....	285
10.3.3 Production Methods of Feedstocks	286
10.3.4 Polymerization/Processing	286
10.3.5 Disposal/Recycling Methods.....	287
10.4 Health and Safety Impacts	287
10.4.1 Catalysts	287
10.4.2 Solvents/Chemicals	287
10.4.3 GMOs.....	288
References.....	288
Appendix I: Patents related to recycling, reuse, and disposal of biopolymers	291
Appendix II: Patents related to degradation on demand.....	315
Appendix III: Supplementary patents.....	325
Appendix IV: Databases consulted.....	351
Appendix V: Further information sources	353
