DESCRIPTORS USED IN THE INDEXES

PATENTEE

Patentee Code

Codes are used to index patentees, the patentee name itself is not indexed. 13,500 large companies have a four letter code which is unique for that company or group. Other companies (four letters followed by — or followed by = for Soviet institutes) and individuals (four letters followed by /) have non-unique codes assigned according to rules. For equivalents, the code and name are those derived from the current specifications. For details consult the Derwent Instruction Manual No. 2A.

Patentee Name

Up to 24 characters, standardised for companies having a unique code. Other names are abbreviated where necessary, using the standard abbreviation list. Codes in brackets after the IPCs represent a joint patentee (for which a separate entry, cross-referenced back to the first patentee, is provided) or the code of the basic, where that was different from the code of the current document.

NUMBER

Patent Number

Two-letter country code (see Appendix I) of the publishing country, followed by a serial number made up of seven characters with preceding hyphens where necessary. The patent number is preceded by an asterisk for a basic; an equals sign for a true equivalent; and a hash sign # for a non-convention equivalent, or an equivalent where a priority not on the current document is input. The patent number is followed by a single letter status indicating the publication stage of the document. Status is most frequently A, becoming B for example on granted British and granted European patents.

Derwent Accession Number

Is the serial number given by Derwent to the basic patent, and to all equivalents published subsequently claiming the same invention.

From July 1983, all basic patents are assigned an accession number comprising a two digit year followed by a six digit serial. The serial will restart from 000001 at the beginning of each succeeding year.

Equivalents to basics issued before July 1983 comprise the two digit year derived from the former Derwent year letter, followed by the old style six character accession numbers including letters.

Basic Patent

By definition, the basic member of a family is the first disclosure of an invention. If the basic chosen by Derwent as being the first received is not the first published, then the country code and publication date of the true earliest disclosure are shown in brackets at the end of the title.

DATE

Publication Date

The patent specification publication date is usually some five to seven weeks earlier than the WPI Gazette date.

Derwent Week Number

Comprises a two digit year followed by the two digit week number within the year. Week 01 for any year contains the first British patents published that year plus patents from other countries available at the same time. Is used in the Accession Number Index (V) and Priority Concordance (VII) to allow location of family members.

Latest Priority

Most patents only claim a single priority, in which case there can be no confusion. However, for the 5% of cases where more than one priority is claimed, the effective one used for determining family relationships is the latest, since all documents having the same latest priority will be expected to contain the same latest information.

The effective or latest priority takes the form of date, country code (see Appendix I) then priority application number to six characters.

Earliest Priority

For multiple priority cases, the earliest priority date, country and number are quoted in brackets in Index I.

For US continuations-in-part, the original application is regarded as an earlier priority provided that it was not based upon a foreign application. For divisional applications, without foreign priority, the earliest application is used for determining equivalency.

CLASSIFICATION

International Patent Classification

The main IPC headings are listed in Appendix II. If two or more IPCs on the same document differ only in the sub-group (characters before slash identical), then only the first is used as a valid IPC. A maximum of twelve valid IPCs from the same document are entered into the computer system. IPCs not appearing on the document, but assigned by Derwent staff, are distinguished by ending with an asterisk.

An equivalent patent is placed in index III under all valid IPCs from the current document, and also under IPCs from earlier family members which have a different sub-class (first 4 characters) from those on the current document.

Derwent Classification

For chemical and related subjects, Chemical Patents Index classes A - M (see inside back cover) are assigned by Derwent according to the technical content of the specification, not necessarily having regard to the Patent Office-assigned IPCs.

For non-chemical topics, WPI classes P, Q, or R are assigned by the computer based upon the IPCs in accordance with the classification shown (inside front cover). Any classes assigned as a result of an equivalent having one or more IPCs different from the basic are prefixed by a plus sign.

WPI Indexes I and III also show Electrical Patents Index (EPI) S-X Classes.

TITLE

A comprehensive English language title is prepared at the same time as the basic abstract is made. This title is in eye-catching bold type with a hyphen separating the principal features from the amplifying details.

For most minor country basics and some unexamined Japanese basics which initially have no abstract included in our abstract services, the term NoAbstract appears at the end of the title.

I - PATENTEE INDEX

Details of all basic and equivalent inventions included in the current week are published in four editions Ch or CHEMICAL, P GENERAL, Q MECHANICAL and R ELECTRICAL.

Within each edition, all entries under a single patentee code are arranged with basics first, followed by equivalents. Within this they are sorted by earliest priority date and then patent number. The patentee code is printed in bold type at the start of the entries and is not repeated for each entry. Cross-reference entries are included for a maximum of three multiple corporate patentees; the codes of the multiple patentees appearing in brackets at the end of the last line of the main entry. In cases where a company and an individual are joint patentees only the company name and code are recorded; where several individuals are joint patentees only the first one is recorded. In the case of European and PCT patents at least one patentee is recorded for each designated state.

Basic entries start with the full Derwent title preceded by an asterisk, for equivalents only the first part of the title is given. The IPCs given are those from the current specification; in the case of equivalents those following a + sign are new to the family. Derwent classes following a + sign have been added from the current or earlier equivalents. Entries with no Derwent accession number are provisional basics (see Appendix 1).

For patentee searches, ascertain the appropriate code from Instruction Manual No. 2A and scan patentee name, titles etc., for items of interest. From the Derwent accession number and classes, the abstract for a particular entry may be located in WPA, EPI or CPI. Knowing the accession number or priority, the patent numbers of family members may be found from the Accession Number Index (V) or the Priority Concordance (VIII) respectively.

Basic entries are cumulated quarterly as COM indexes covering Derwent Weeks 1-13, 1-26 and 1-39, and then incorporated yearly into cumulations of up to 10 years.
