## Preface

Computer analysis of images and patterns is a scientific field of longstanding tradition, with roots in the early years of the computer era when *electronic brains* inspired scientists. Moreover, the design of vision machines is a part of humanity's dream of the artificial person.

I remember the 2nd CAIP, held in Wismar in 1987. Lectures were read in German, English and Russian, and proceedings were also only partially written in English. The conference took place under a different political system and proved that ideas are independent of political *walls*. A few years later the Berlin Wall collapsed, and Professors Sommer and Klette proposed a new formula for the CAIP: let it be held in Central and Eastern Europe every second year. There was a sense of solidarity with scientific communities in those countries that found themselves in a state of transition to a new economy. A well-implemented idea resulted in a chain of successful events in Dresden (1991), Budapest (1993), Prague (1995), Kiel (1997), and Ljubljana (1999).

This year the conference was welcomed at Warsaw. There are three invited lectures and about 90 contributions written by more than 200 authors from 27 countries. Besides Poland (60 authors), the largest representation comes from France (23), followed by England (16), Czech Republic (11), Spain (10), Germany (9), and Belarus (9). Regrettably, in spite of free registration fees and free accommodation for authors from former Soviet Union countries, we received only one accepted paper from Russia.

Contributions are organized into sessions corresponding to the scope of the conference: image analysis (20 papers), computer vision (12), pattern recognition (12), medical imaging (10), motion analysis (8), augmented reality (4), image indexing (7), image compression (8), and industrial applications (6). Several brilliant results are presented and in my opinion the average level of quality of the contributions is high. New trends in these disciplines are well represented.

The 9th conference on *Computer Analysis of Images and Patterns* was organized at Warsaw University of Technology, in September 2001, under the auspices of its Rector, Professor Jerzy Woznicki. We appreciate the kind patronage of the International Association for Pattern Recognition (IAPR) and the Polish Association for Image Processing, the Polish Section of Institute of Electrical and Electronics Engineers, and of the Institute of Radioelectronics in the Department of Electronics and Information Technology.

Major sponsorship was received from Altkom Akademia S.A., a private educational institution in Poland. We also thank The Foundation for the Development of Radiocommunication and Multimedia Technologies for support.

# MPEG-7: Evolution or Revolution?

Mirosław Bober

Visual Information Laboratory  
Mitsubishi Electric Information Center Europe  
20 Frederic Sanger Road, Surrey Research Park  
Guildford, GU1 2SE, UK  
mirosław.bober@vil.ite.mee.com

**Abstract.** The ISO MPEG-7 Standard, also known as a Multimedia Content Description Interface, will be soon finalized. After several years of intensive work on technology development, implementation and testing by almost all major players in the digital multimedia arena, the results of this international project will be assessed by the most cruel and demanding judge: the market. Will it meet all the high expectations of the developers and, above all, future users? Will it result in a revolution, evolution or will it just simply pass unnoticed?

In this invited lecture, I will review the components of the MPEG-7 Standard in the context of some novel applications. I will go beyond the classical image/video retrieval scenarios, and look into more generic image/object recognition framework relying on the MPEG-7 technology. Such a framework is applicable to a wide range of new applications. The benefits of using standardized technology, over other state-of-the art techniques from computer vision, image processing, and database retrieval, will be investigated. Demonstrations of the generic object recognition system will be presented, followed by some other examples of emerging applications made possible by the Standard. In conclusion, I will assess the potential impact of this new standard on emerging services, products and future technology developments.

**Keywords:** MPEG-7, multimedia database retrieval, multimedia object recognition

# The MPEG-7 Visual Description Framework – Concepts, Accuracy, and Applications

Jens-Rainer Ohm

Rheinisch-Westfälische Technische Hochschule Aachen,  
Institut für Nachrichtentechnik  
Melatener Str. 23, D-52072 Aachen, Germany  
ohm@ient.rwth-aachen.de

**Abstract.** This paper gives a brief introduction into the Visual part of the forthcoming new standard MPEG-7, the "Multimedia Content Description Interface". It then emphasizes on the aspects how the Visual Descriptors of MPEG-7 were optimized for efficiency, compactness and behavior similar to human visual characteristics. The MPEG-7 descriptors were mainly designed for signal identification and recognition in the context of multimedia applications ; however, they are applicable wherever interoperability between distributed systems designed for the task of visual information recognition need a standardized interface. In this sense, MPEG-7 may become a key element in the process of convergence of multimedia related applications with computer vision systems.

**Keywords:** MPEG-7, visual descriptor, application scenario

## 1 Introduction

Recently, ISO's Moving Pictures Experts Group (MPEG) has finalized the standardization of the "Multimedia Content Description Interface", called MPEG-7, which shall provide standardized feature description tools for audiovisual data [1][2]. Part 3 of the standard is handling Visual feature description. Even though database retrieval is foreseen as one of the first and most illustrative applications of MPEG-7, the general applicability of this description framework is much broader, installing a link between image/video coding and visual-signal recognition techniques. MPEG-7 is not a competitor with previous MPEG standards (MPEG-1, MPEG-2, MPEG-4), which were mainly designed for encoding of audiovisual signals with the goal of *reconstruction and rendering* with highest quality. Moreover, it is a step towards the next-higher level of signal representation, describing *signal features*, not *signal samples*. This is highly valuable in the context of systems dealing with the *content* of audiovisual signals, such as automatic identification and recognition systems. The need for a standard arises when interoperability between distributed systems on visual information is necessary, or communication between a human user and a machine about visual information is

required. This paper gives a coarse overview about the Visual elements of the MPEG-7 standard (section 2), explain how the MPEG-7 Visual Descriptors were designed taking into account the characteristics of human perception (section 3), and point out possible applications from different areas as indicated above (section 4).

## 2 The MPEG-7 Standard and Its Visual Part

The meaning of "content features" to be described by MPEG-7 is widespread, and can consist of elements for

- high-level description (e.g. manually-generated metadata like authoring information, scripting and editing information) ;
- mid-level description (e.g. rule-based semantic categories of objects or subjects present within a scene) ;
- low-level description (e.g. basic visual features like color, texture, shape, geometry, motion within a scene or of a camera).

The work reported in this contribution concentrates on the low-level visual feature description aspects, in which case automatic extraction of features from the data is usually possible, and definition of matching criteria for the similarity using a specific feature type is more or less unique. Even though, it is not the intention that MPEG-7 standardizes the feature extraction, nor the search/retrieval algorithms, which may be differently optimized for specific applications. However, for some features at a very low level, the feature extraction process must be more or less unique, and had to be specified as the semantic meaning of a description element. This is of high importance for interoperability between different systems, or an automatic system and a human, where the "common understanding" about what a specific feature description means must be clear.

Fig. 1. Example of a simple hierarchical MPEG-7 description scheme structure.

An MPEG-7 description is structured in terms of *Description Schemes (DS)* and *Descriptors (D)*, the latter ones instantiated as *Descriptor Values (DV)*. A description scheme can contain one or more descriptor(s) and/or subordinate description scheme(s). An example is illustrated in Fig.1, where the DS "A" is the top-level DS, containing the Ds "A" and "B", and DS "B", which again is containing Ds "C" and
