INTRODUCTION

The report of the Joint Meeting of the FAO Panel of Experts on Pesticide Residues in Food and the Environment and the WHO Expert Group on Pesticide Residues, held in Rome, 21-30 September 1992, contains a summary of the evaluations of residues in foods of the various pesticides considered as well as information on the general principles followed by the Meeting. The present document contains summaries of the residues data considered, together with the recommendations made.

The Evaluations are issued in two parts:

Part I: Residues (by FAO)
Part II: Toxicology (by WHO)

For those interested in both aspects of pesticide evaluation, not only both parts but also the reports containing summaries of residue and toxicological considerations will be available. Special attention is drawn to Annex I containing updated ADIs, MRLs and temporary ADIs and MRLs, which also appears in full as part of the report of the Meeting.

Some of the compounds considered at this Meeting have been previously evaluated and reported on in earlier publications. In general only new information is summarized in the relevant monographs and reference is made to previously published evaluations, which should also be consulted. In the case of older compounds which are re-evaluated as part of the periodic review programme of the Codex Committee on Pesticide Residues (CCPR) however a comprehensive review of all available data, including data which may have previously been submitted, is carried out. Compounds evaluated for the first time are indicated by a single asterisk and those evaluated in the CCPR periodic review programme by a double asterisk in the Table of Contents.

The name of the compound appearing as the title of each monograph is followed by its Codex Classification Number in parentheses.

References to previous Reports and Evaluations of Joint Meetings are listed in Annex II.

Acknowledgements

The monographs in these Evaluations were prepared by the following participants in the 1992 JMPR for the FAO Panel of Experts on Pesticide Residues in Food and the Environment: Dr A. Ambrus, Dr. R. Greenhalgh, Mr D.J. Hamilton, Mr F. Ives, Dr J.-R. Lundehn, Mr A.F. Machin, Mr B. Murray, Mr K. Voldum-Clausen and Professor Wuji Zhuang.

ABAMECTIN (177)

IDENTITY

ISO common name: abamectin

Chemical name: abamectin is a mixture of components, B_{ia} (≥ 80 %) and B_{ib} (≤ 20 %).

Component Bia

IUPAC: (2aE, 4E, 8E) - (5'S, 6S, 6'R, 7S, 11R, 13S, 15S, 17aR, 20R, 20aR, 20bS) - 6' - [(S) - sec - butyl] - 5', 6, 6', 7, 10, 11, 14, 15, 17a, 20, 20a, 20b - dodecahydro - 20, 20b - dihydroxy - 5', 6, 8, 19 - tetramethyl - 17

CAS: 5-0-demethylavermectin Ala

Component B_{1b}

IUPAC: $(2aE, 4E, 8E) - (5'S, 6S, 6'R, 7S, 11R, 13S, 15S, 17aR, 20R, 20aR, 20bS) - (5'S, 6S, 6'R, 7S, 11R, 13S, 15S, 17aR, 20R, 20aR, 20bS) - (5', 6, 6', 7, 10, 11, 14, 15, 17a, 20, 20a, 20b-dodecahydro-20, 20b-dihydroxy-6'-isopropyl-5', 6, 8, 19-tetramethyl-17-oxospiro[11, 15-methano-2H, 13H, 17H-furo[4, 3, 2-pq][2, 6]benzodioxacyclooctadecin-13, 2'-[2H]pyran]-7-yl 2, 6-dideoxy-4-O-(2, 6-dideoxy-3-O-methyl-<math>\alpha$ -L-arabino-hexopyranosyl)-3-O-methyl- α -L-arabino-hexopyranoside.

CAS: 5-O-demethyl-25-de(1-methylpropyl)-25-(1-methylethyl)avermectin A_{la}

CAS Registry No: Component B_{la} 65195-55-3

Component B_{1b} 65195-56-4

Synonyms: Avermectin B_1 , MK-936

Molecular formula: Component B_{1a} C₄₈H₇₂O₁₄

Component B_{1b} C₄₇H₇₀O₁₄

Molecular weight: Component B_{la} 873.11

Component B_{1h} 859.08

Structural formula:

2

Physical and chemical properties of abamectin

Physical state: odourless white to yellowish-white

crystalline powder.

Melting point: 155-157°C (with decomposition)

Density: 1.16

Vapour pressure: <0.0004 mPa

Octanol/water partition coefficient: log Pow 3.96

Solubility at 21°C:

Hydrolysis: stable to hydrolysis at pH 5, 7 and 9 at 25°C in the dark.

<u>Formulation</u>. Abamectin is formulated in an 18 g ai/l EC formulation as an acaricide/insecticide for use on agricultural, horticultural and ornamental crops. An abamectin injectable formulation is also registered as an endo- and ecto-parasiticide in cattle, and abamectin bait formulations are used for the control of household pests.

A monograph (Campbell, ed, 1989) has been published on the chemistry, production, toxicology, metabolism, uses and analytical methods for ivermectin and abamectin.

USE PATTERN

Abamectin is a macrocyclic lactone product derived from the soil microorganism Streptomyces avermitilis, which controls a number of plant-feeding mites and insects on agricultural and horticultural crops. It is most effective as an ingestion toxicant, but also has some contact activity. It is active against motile mites and insect larvae, but has no ovicidal activity. Surface residues dissipate rapidly. Use in combination with a paraffin crop oil increases foliar penetration, so extending residual activity against mites and pear psylla. abamectin 3

Registered and proposed registered uses of abamectin on agricultural and horticultural crops are shown in Table 1. Recommendations for citrus and pears include the addition of a spray oil, usually at 0.25% of the spray volume.

Table 1. Registered uses and proposed registered uses of abamectin.

RESIDUES RESULTING FROM SUPERVISED TRIALS

Residue data from supervised trials on horticultural and agricultural crops are summarised in tables 2 to 20. The data in the tables are not corrected for analytical recovery.

Citrus

Abamectin was applied to crops of lemons and oranges in supervised trials in Argentina in 1989-90 (Table 2). There were 4 applications of an EC formulation (18 g/l) together with an added spraying oil, at intervals of 55-77 days. Samples from 4 replicates were composited into a single sample for analysis.

Residue data from supervised trials on oranges in the principal citrus growing areas of Brazil (Sao Paulo and Minas Gerais) in 1982-83 and 1983-84 are summarized in Table 3. There were 2 or 4 applications of an EC formulation (18 g/l) at intervals of 60 days. In the second season a spraying oil was included. Peel and pulp were analysed separately, with residues detected in pulp on only one occasion.

Supervised trials on citrus (orange, grapefruit, lemon and tangelo) were conducted in the major citrus growing areas of the USA in 1983, 1984 and 1986 (Tables 2 and 4). An EC formulation (18 g/l) was applied in association with a spraying oil up to 4 times, with intervals between applications of 17 to 92 days. Plot size was 4 to 32 trees comprising in each case replicate sub-plots to provide 3 or 4 samples for analysis at each sampling date.

The method used in 1983 and 1984 gave poor recovery of the Δ -8,9 isomer, which forms a minor part of the residue, and does not affect the
