

Web Programming in Python

**TECHNIQUES FOR INTEGRATING
LINUX, APACHE, AND MySQL**

- Build production-quality Web applications with Python and open source technology
- Includes in-depth coverage of Python's intrinsic support for CGI programming
- Demonstrates efficient template processing using a powerful yet simple module known as the Write Processor
- Contains complete tutorials on Python, Apache Web Server, and MySQL
- Features start-to-finish Web application case studies based on Slither, a new Python-based portal application development platform

*We collectively dedicate this book to the
loving memory of great programming languages
that have come and gone.*

—GKT, JPS, TWC

Acknowledgments

I wish to extend thanks and love to my wife, Nina, who has been a constant source of support throughout this project. It is a joy and a privilege to have a home environment that is conducive to being a writer. You're the best, Bumks!

Happiness is working on a great project with two great friends! This project presented a great challenge to all of us as we faced many changes during the past year. Thanks to both John and Thomas for their patience and efforts on this project. Let's get some beer before we forget that we've written this book.

I wish to extend a special thank you to Konstantin Laufer of Loyola University for helping me to find my way back to the computer science faculty at Loyola and Alok Choudhary for his support as an adjunct professor and visiting scholar at Northwestern University. It is an honor to have colleagues like both of you, and this book is very much made possible by your support.

Finally, I wish to extend a special thanks to Mary Franz at Prentice Hall for her enduring faith in us and our work. I would also like to extend my appreciation to our entire production staff, including but not limited to Rose Kernan, Eileen Clark, and Maureen Brigham. It is truly a pleasure to work with them (again). I think of them as the last leg in a track and field relay event.

I wish to dedicate this book to my father, who still goes around showing the previous book to his friends and other family members, and to the memory of my dog Fuzzy.

Go Cubs! Better luck next year.

—George K. Thiruvathukal, Chicago, Illinois, August 19, 2001

I would like to thank all of the people at Hostway for their insightful ideas and comments. Specifically I would like to thank Jason K. Duffy for the countless hours spent exploring and improving on the concepts and applications discussed in the text. He has provided great insight on the Slither architecture and several of the underlying components. I would also like to thank Jason M. Abate and Joe Eaton for introducing me to new Python Web technologies and working with several of the early, unstable versions of the wpl libraries. Finally, I would like to give many thanks to Lucas Roh for his support and guidance throughout this project as well as at Hostway. I could not have finished this book and explored the listed technologies if it was not for his encouragement and backing.

We truly enjoyed working on the book at the Zirve! lab. I would also like to thank Joseph Brunzelle and Marie Perez for helping proof-read chapters and using the tools and applications presented here before they were fully developed. I would also like to thank Robert Luzynczyk for his patience and support.

Finally, I would like to dedicate this book to my family (Iraj, Shahla, and Pantra). I could not have done this without your love and support.

—John P. Shafae, Chicago, Illinois, June 17, 2001

I would like to thank my wife Patricia Guilbeault and my son Nick Guilbeault for providing my life with a sense of meaning and belonging that has allowed me to devote my attention to writing this book. My appreciation also goes to the Department of Computer Science at Illinois Institute of Technology in Chicago where I was a professor for 20 years.

—Thomas Christopher, Evanston, Illinois, June 15, 2001
