Preface to the First English Edition

The two German editions of the “Lehrbuch für Lebensmittelchemie” were so well accepted not only as an university textbook but also as a first comprehensive source of information for people in science, industry, official food control and administration, that the publishing house, Springer Verlag (Heidelberg), decided to edit an English version.

The first English edition is actually the second German edition which was revised for this purpose.

We are specially thankful to our colleague Prof. Dr. D. Hadziyev for the translation of the book.

Garching, December 1986

Preface to the Second German Edition

Appreciative critiques and rapid sales have indicated that the first edition of our books has been well received by many readers.

A second print run was dictated therefore, earlier than expected, so that in this second edition we have concentrated on correcting errors and updating statistical data. Nevertheless, we have done our best to adapt the text to include the most important, recent developments and, where appropriate, the references have also been brought up to date. With respect to the latter it is important to emphasize that a textbook should, apart from discussing the state of the art, provide an incentive for more intensive study.

Our thanks are due to all readers who have assisted us in preparing this second edition by pointing out errors and proofreading by their constructive criticism. For the preparation of the manuscript and we are indebted to Mrs. A. Mödel (food chemist), Mrs. R. Berger, Mrs. J. Hahn, Mrs. I. Hofmeier, Mrs. H. Troesch and Mrs. K. Wuest. Once again, we would like to acknowledge the pleasant cooperation of our publishers.

Garching, September 1984

H.-D. Belitz, W. Grosch

Preface to the First German Edition

The very rapid development of food chemistry and technology over the last two decades, due to a remarkable augmentation to the analytical and manufacturing possibilities, make the complete lack of a comprehensive, teaching or reference text particularly noticeable. It is hoped that this textbook of food chemistry will help to fill this gap. In writing this volume we were able to draw on our experience from the lectures which we have given, covering various scientific subjects, over the last fifteen years at the Technical University of Munich.

Since a separate treatment of the important food constituents (proteins, lipids, carbohydrates, flavor compounds etc.,) and of the important food groups (milk, meat, eggs, cereals, fruits, vegetables, etc.,) has proved successful in our lectures, the subject matter is also organized in the same way in this book.

Compounds which are found only in particular foods are discussed where they play a distinctive role while food additives and contaminants are treated in their own chapters. The physical and chemical properties of the important constituents of foods are discussed in detail where these form the basis for understanding either the reactions which occur, or can be expected to occur, during the production, processing, storage and handling of foods or the methods used in analyzing foods. An attempt has also been made to clarify the relationship between the structure and properties at the level of individual food constituents and at the level of the whole food system.

The book focuses on the chemistry of foodstuffs and does not consider national or international food regulations. We have also omitted a broader discussion of aspects related to the nutritional value, the processing and the toxicology of foods. All of these are an essential part of the training of a food chemist but, because of the extent of the subject matter and the consequent specialization, must, today, be the subject of separate books. Nevertheless, for all important foods we have included brief discussions of manufacturing processes and their parameters since these are closely related to the chemical reactions occurring in foods.

Commodity and production data, of importance to food chemists, are mainly given in tabular form. Each chapter includes some references which are not intended to form an exhaustive list and no preference or judgement should be inferred from the choice of references; they are given simply to encourage further reading. Additional literature of more general nature is given at the end of the book.

This book is primarily aimed both at students of food and general chemistry but also at those students of other disciplines who are required, or choose to study food chemistry as a subsidiary subject. We also hope that this comprehensive text will prove useful to both food chemists and chemists generally who have completed their formal education.

We thank sincerely Mrs. A. Mödl (food chemist), Mrs. R. Berger, Mrs. I. Hofmeier, Mrs. E. Hortig, Mrs. F. Lynen and Mrs. K. Wüst for their help during the preparation of the manuscript and its proofreading. We are very grateful to Springer Verlag for their consideration of our wishes and for the agreeable cooperation.

Foreword of the Translator

Providing basic and applied information on the state of knowledge within food science and technology is a constant challenge. This translation presents an intellectually digested overview of the ever provoking field of food chemistry. The translation is a textbook in the German sense which means it is both a textbook and a reference. It is a handbook in the North American sense, which means a comprehensive, one volume reference. Also, it exemplifies how to write a chemically oriented text without excessive repetition of basic disciplines and food processing, and showing that many food science disciplines are mature enough to be dealt with separately. On the basis of the revised second German edition, the book was additionally revised, upgraded and supplemented with English references all in a joint pursuit to develop an English edition.

Often being asked why I embarked on a "linguistic exercise" rather than writing my own book, the answer is intimately connected with the way humans deal with knowledge. If it is good, our duty is to remove its language barrier and let it be disseminated. Furthermore there were other attributes.

The authors are my personal friends. One is administrator of the Institute of Food Chemistry, Technical University Munich, where both are wonderful teachers and scientists. They are highly regarded by the scientific community for their work on the extent and mechanism of lipid oxidation, carotenoid cooxidation, and for the field of proteinase enzymes and their natural inhibitors in cereals and vegetables. Also, the correlation of sensory properties of peptides and other compounds with their structures and/or extent of protein hydrolysis is a highlight of their research. The authors reliably recount the vast heritage and progress in food chemistry in post-war Germany. Admittedly, the latter developed separately rather than closely interrelated with other countries. Hence, the translation reflects this process and sheds light on the present status of their teaching within their University degree programs.

The translation aims to serve the needs of senior undergraduate and graduate students and to serve as a handbook for teaching staff and graduates employed by baking, brewing, dairy, meat and other food industries, Agriculture and Government agencies. This is especially so since it meets the revised minimum curriculum standards set by the Institute of Food Technologists.

The translation generally follows the American style and spelling (odor or flavor rather than odour or flavour) and for compound nomenclature follows the recommendations of the Merck Index, tenth edition, with some exceptions (e.g. an "e" in flavine, but not in riboflavin, or often prolamines rather than exclusively prolamin).

It is a pleasure to acknowledge the commendable cooperation of the authors, and the skill and assistance of Leonard Steele and Judy Nuss. Also valuable was the release from active teaching, administrative and extension work by being granted a study leave – special thanks are due to my Department of Food Science and the Faculty of Agriculture and Forestry.

Edmonton, December 1986

D. Hadziyev

Introduction

Foods are materials which, in their naturally occurring, processed or cooked forms, are consumed by humans as nourishment and for enjoyment.

The terms "nourishment" and "enjoyment" introduce two important properties of foods: the nutritional value and the enjoyment value. The former is relatively easy to quantify since all the important nutrients are known and their effects are defined. Furthermore, there are only a limited number of nutrients. Defining the enjoyment value of a food is more difficult because such a definition must take account of all those properties of a food, such as visual appeal, smell, taste and texture, which interact with the senses. These properties can be influenced by a large number of compounds which in part have not even been identified. As well as for its nutritional and enjoyment values food is increasingly being judged according to properties which determine its value in use. Thus, the term "convenience foods". An obvious additional requirement of a food is that it be free from toxic materials.

Food chemistry is involved, not only in elucidating the composition of the raw materials and end-products, but also with the changes which occur in food during its production, processing, storage and cooking. The highly complex nature of food results in a multitude of desired and undesired reactions which are controlled by a variety of parameters. To gain a meaningful insight into these reactions, it is necessary to dissolve the food into model systems. Thus, starting from compositional analyses (detection, isolation and structural characterisation of food constituents), the reactions of a single constituent or of a simple mixture are followed. Subsequently, an investigation of a food in which an individual reaction dominates can be made. Inherently, such a study starts with a given compound and is thus not restricted to any one food or group of foods. Such general studies of reactions involving food constituents are supplemented by special investigations which focus on chemical processes in individual foods. Research of this kind is, from the very beginning, closely associated with economic and technological aspects and contributes, by understanding the basics of the chemical processes occurring in foods, both to resolving specific technical problems and to process optimization.

A comprehensive evaluation of foods requires that analytical techniques keep pace with the available technology so that a major part of food chemistry is concerned with the application and continual development of analytical methods. This aspect is particularly important with respect to possible contamination of foods with substances which may involve a health risk. Thus, there are close links with environmental problems.

Food chemistry research is aimed at establishing objective scales by which the criteria mentioned above – nutritional value, enjoyment value, absence of toxic compounds and convenience – can be evaluated. These are a prerequisite for the production of high quality food in sufficient quantity.

The brief outline given here makes clear that food chemistry, unlike other branches of chemistry which are concerned either with particular classes of compounds or with particular methods, is a subject which, both in terms of the actual chemistry and the methods involved, has a very broad field to cover.

Table of Contents

0	Water	1
0.1	Foreword	1
0.2	Structure	1
0.2.1	Water Molecule	1
0.2.2	Liquid Water and Ice	2
0.3	Water Binding	3

3.7.4	Fat or Oil Heating (Deep Frying)	178
3.7.4.1	Autoxidation of Saturated Acyl Lipids	179
3.7.4.2	Polymerization	180
3.7.5	Microbial Degradation of Acyl Lipids to Methyl Ketones.	181
3.8	Unsaponifiable Constituents	182
3.8.1	Hydrocarbons	183
3.8.2	Steroids and Steroid Derivatives	183
3.8.2.1	Structure and Nomenclature	183
3.8.2.2	Steroids of Animal Food	184
3.8.2.2.1	Cholesterol	184
3.8.2.2.2	Vitamin D	184
3.8.2.3	Plant Steroids (Phytosterols)	184
3.8.2.3.1	Demethylsterols	184
3.8.2.3.2	Methyl- and Dimethylsterols	186
3.8.2.4	Analysis	187
3.8.3	Tocopherols and Tocotrienols	188
3.8.3.1	Structure, Importance	188
3.8.3.2	Analysis	189
3.8.4	Carotenoids	189
3.8.4.1	Chemical Structure, Occurrence	190
3.8.4.1.1	Carotenes	190
3.8.4.1.2	Xanthophylls	191
3.8.4.2	Physical Properties	194
3.8.4.3	Chemical Properties	195
3.8.4.4	Precursors of Aroma Compounds	195
3.8.4.5	Use of Carotenoids in Food Processing.	196
3.8.4.5.1	Plant Extracts	196
3.8.4.5.2	Individual Compounds	197
3.8.4.6	Analysis	197
3.9	Literature	198

4.1	Foreword	201
4.2	Monosaccharides	201
4.2.1	Structure and Nomenclature	201
4.2.1.1	Nomenclature	201
4.2.1.2	Configuration	202
4.2.1.3	Conformation	206
4.2.2	Physical Properties	206
4.2.2.1	Hygroscopicity and Solubility	208
4.2.2.2	Optical Rotation, Mutarotation	208
4.2.3	Sensory Properties	209
4.2.4	Chemical Reactions and Derivatives	209
4.2.4.1	Reduction to Sugar Alcohols	212
4.2.4.2	Oxidation to Aldonic, Dicarboxylic and Uronic Acids	212
4.2.4.3	Reactions in the Presence of Acids and Alkalies	212
4.2.4.3.1	Reactions in Strongly Acidic Media	213
4.2.4.3.2	Reactions in Strongly Alkaline Solution	213
4.2.4.3.3	Caramelization	217
4.2.4.4	Reactions with Amino Compounds (N-Glycosides, Maillard Reaction)	218
4.2.4.5	Reactions with Hydroxy, Compounds (O-Glycosides)	219
4.2.4.6	Esters	226
4.2.4.7	Ethers	227
4.2.4.8	Oxidative Cleavage of 1,2-Diols	227
4.3	Oligosaccharides	228
4.3.1	Structure and Nomenclature	228
4.3.2	Properties and Reactions	229
4.4	Polysaccharides	231
4.4.1	Classification, Structure	231
4.4.2	Conformation	231
4.4.3	Properties	234
4.4.3.1	General Remarks	234
4.4.3.2	Perfectly-Linear Polysaccharides	235
4.4.3.3	Branched Polysaccharides	235
4.4.3.4	Linearly-Branched Polysaccharides	235
4.4.3.5	Polysaccharides with Carboxyl Groups	236
4.4.3.6	Polysaccharides with Strongly Acidic Groups	236
4.4.3.7	Modified Polysaccharides	236
4.4.3.7.1	Derivatization with Neutral Substituents	236
4.4.3.7.2	Derivatization with Acidic Substituents	236
4.4.4	Individual Polysaccharides	236
4.4.4.1	Agar	236
4.4.4.2	Alginates	237
4.4.4.3	Carrageenans	238
4.4.4.4	Furcellaran	240
4.4.4.5	Gum Arabic	240
4.4.4.6	Gum Tragacanth	241
4.4.4.7	Guaran Gum	242
4.4.4.8	Locust Bean Gum	242
4.4.4.9	Tamarind Flour	243
4.4.4.10	Arabinogalactan from Larch	243
4.4.4.11	Pectin	244
4.4.4.12	Starch	245
4.4.4.12.1	General Remarks	245
4.4.4.12.2	Amylose Structure and Properties	246
4.4.4.12.3	Amylopectin Structure and Properties	249

4.4.4.12.4	Utilization	250
4.4.4.13	Modified Starches	250
4.4.4.14	Cellulose	252
4.4.4.15	Cellulose Derivatives	252
4.4.4.16	Xanthan Gum	254
4.4.4.17	Screloglucan	255
4.4.4.18	Dextran	255
4.4.4.19	Polyvinyl Pyrrolidone (PVP)	256
4.5	Literature	256
5	Aroma Substances	257
5.1	Foreword	257
5.1.1	Concept Delineation	257
5.1.2	Threshold Value	257
5.1.3	Impact Compounds of Natural Aroma	258
5.1.4	Off-Flavors	258
5.2	Aroma Analysis	260
5.2.1	Aroma Isolation	260
5.2.1.1	Distillation, Extraction	260
5.2.1.2	Gas Extraction	261
5.2.1.3	Headspace Analysis	261
5.2.2	Separation	262
5.2.3	Chemical Structure	262
5.2.4	Sensory Properties	264
5.2.4.1	Aroma Value	264
5.2.4.2	Sensory Analysis of GC-Peaks	265
5.2.4.3	Statistical Analysis	265
5.3	Individual Aroma Compounds	266
5.3.1	Nonenzymatic Reactions	267
5.3.1.1	Carbonyl Compounds	267
5.3.1.2	Pyrones	268
5.3.1.3	Furans	268
5.3.1.4	Lactones	271
5.3.1.5	Thiols, Thioethers, Di- and Trisulfides	271
5.3.1.6	Thiophenes	273
5.3.1.7	Thiazoles	274
5.3.1.8	Oxazoles	274
5.3.1.9	Pyroles	275
5.3.1.10	Pyrazines	275
5.3.1.11	Phenols	278
5.3.2	Enzymatic Reactions	280
5.3.2.1	Carbonyl Compounds, Alcohols	280
5.3.2.2	Esters	282
5.3.2.3	Terpenes	282
5.3.2.4	Volatile Sulfur Compounds	290
5.3.2.5	Pyrazines	291

6.1	Foreword	305
6.2	Fat-Soluble Vitamins	305
6.2.1	Retinol (Vitamin A)	305
6.2.1.1	Biological Role	305
6.2.1.2	Requirement, Occurrence	307
6.2.1.3	Stability, Degradation	307
6.2.2	Calciferol (Vitamin D)	307
6.2.2.1	Biological Role	307
6.2.2.2	Requirement, Occurrence	310
6.2.2.3	Stability, Degradation	310
6.2.3	a-Tocopherol (Vitamin E)	310
6.2.3.1	Biological Role	310
6.2.3.2	Requirement, Occurrence	310
6.2.3.3	Stability, Degradation	310
6.2.4	Phytomenadione (Vitamin K ₁)	311
6.2.4.1	Biological Role	311
6.2.4.2	Requirement, Occurrence	311
6.2.4.3	Stability, Degradation	311
6.3	Water-Soluble Vitamins	311
6.3.1	Thiamine (Vitamin B ₁)	311
6.3.1.1	Biological Role	311
6.3.1.2	Requirement, Occurrence	311
6.3.1.3	Stability, Degradation	312
6.3.2	Riboflavin (Vitamin B ₂)	313
6.3.2.1	Biological Role	313
6.3.2.2	Requirement, Occurrence	313
6.3.2.3	Stability, Degradation	313
6.3.3	Pyridoxine (Pyridoxal, Vitamin B ₆)	313
6.3.3.1	Biological Role	313
6.3.3.2	Requirement, Occurrence	313
6.3.3.3	Stability, Degradation	314
6.3.4	Nicotinamide (Niacin)	314
6.3.4.1	Biological Role	314
6.3.4.2	Requirement, Occurrence	314
6.3.4.3	Stability, Degradation	314
6.3.5	Pantothenic Acid	314
6.3.5.1	Biological Role	314
6.3.5.2	Requirement, Occurrence	314
6.3.5.3	Stability, Degradation	315
6.3.6	Biotin	315
6.3.6.1	Biological Role	315
6.3.6.2	Requirement, Occurrence	315
6.3.6.3	Stability, Degradation	315
6.3.7	Folic Acid	315
6.3.7.1	Biological Role	315
6.3.7.2	Requirement, Occurrence	315
6.3.7.3	Stability, Degradation	316
