AUTOMOTIVE INTERNETWORKING

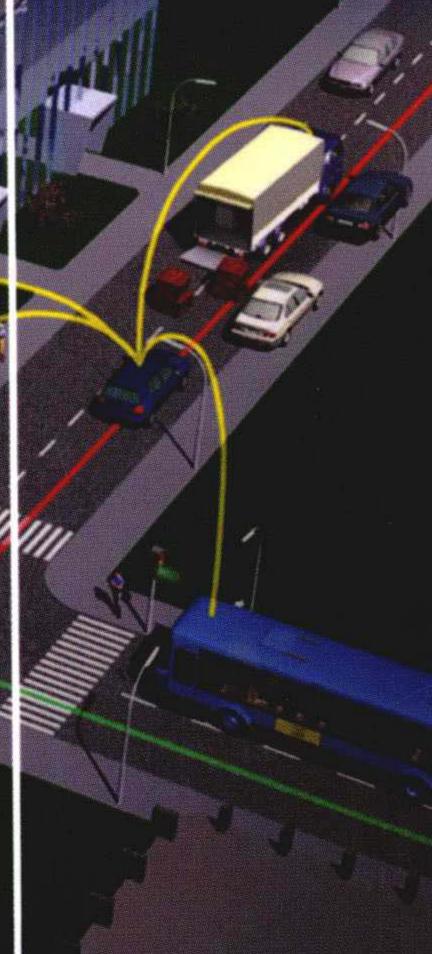

Timo Kosch, Christoph Schroth, Markus Strassberger and Marc Bechler

Intelligent Transportation Systems

AUTOMOTIVE INTERNETWORKING

Timo Kosch, BMW Group Research and Technology, Germany
Christoph Schroth, Alumnus of the University of St. Gallen, Switzerland
Markus Strassberger and Marc Bechler, BMW Group Research and Technology, Germany

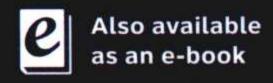

This book introduces a range of new network and system technologies for vehicle safety, entertainment and comfort systems currently being researched and developed. In addition, the authors provide an insight into the background of technical developments, discussing the potential benefits, costs and risks. Furthermore, the book discusses the concepts related to the application of vehicle-to-vehicle and vehicle-to-infrastructure communications, offering in-depth explanations of the new applications, network and system technologies, which are valuable for the engineer developing such systems and the research expert alike.

The book covers all aspects from distributed information handling, situation assessment, security, privacy, system management up to algorithms for driver assistance and vehicle control systems. Beyond technology, the book also addresses economic, organisational and political challenges. Often overlooked, their influence on the success of automotive internetworking is just as important.

Key Features:

- Presents a comprehensive top-down approach to the newly evolving car-to-X communications networking
- Provides a broad overview of all relevant C2X communication topics
- Written by well known experts in the field
- Predicts the outlook of the evolvement of inter-vehicle communications in the next decades
- Includes illustrations and high-level technical sketches of application domains and photographs, 3D renderings and professional graphical sketches of current prototypes

Preface

Tow Stories

Tug-of-war (or towing) games are known in almost every country of the world – in fact, a tug-of-war competition is an ancient team sport, which is still very popular today. In Germany, we have the famous phrase 'den Karren aus dem Dreck ziehen', which literally means to 'tow' something ('a trolley') out of a precarious situation towards a successful destination. The introduction of a new technology into the market can be considered as a *tow story*, too. This is in particular true for cooperative transportation systems based on AutoNets, which may be seen as a tow story of three parts:

- 1. In the first part of the story, a heavy trolley called 'AutoNet' needs to be defined and constructed.
- 2. In the main section, this trolley must be towed along a long and challenging path with several hurdles.
- 3. At the happy end of the tow story, the trolley passes the market introduction successfully.

Interestingly, the early days of cooperative transportation systems already outlined the correlation to tow stories. CHAUFFEUR, one of the first and pathbreaking projects in this field, developed a 'tow bar, which links two trucks electronically'. Whereas the market introduction of a new technology is new to the stakeholders, the rules for a tow story are well understood by the players. Let's see what we can learn from these experiences for our challenging AutoNet tow story:

- Since the AutoNet trolley is pretty heavy, it is not possible for single keyplayers to manage the task. Instead, lots of manpower, expertise and suitable equipment are required to construct the AutoNet trolley and to get it moving. Moreover, a robust tow is essential, which will not break; and all players have to be convinced in the robustness and solidity of the tow.
- Obviously, all players have to push the tow as hard as possible. Otherwise, the movement of the AutoNet trolley will stop immediately. However, physics also teaches us that pure strength is only half the truth: in order to maximise the overall strength, all force vectors have to point (and to tow) in the same direction. Of course, this direction must be defined and agreed among the players in advance.

¹ Quoted from http://cordis.europa.eu/telematics/tap_transport/research/projects/chauffeur.html.

 We must not forget that pulling a tow also requires a good portion of skill and interaction rules. Otherwise, it may become inconvenient for players. For example, on sloping roads the players have to cooperate in a fair and foreseeable way to avoid the event that the tow winds around the neck of some players. This is often painful – and may even be dangerous – for the respective players.

Tow stories are also useful for writing a book. It is a hard work to tow a book trolley towards the successful publication of the book. Since the book trolley is also pretty heavy, it is impossible for the authors to tow the trolley towards successful completion without the valuable support and the excellent contribution of many other players. We want to thank all supporters that directly and indirectly helped and supported (and motivated) us during the writing and finalisation process. We are very happy about this great support; their contributions definitively helped to improve the quality of this book, which is one of the most important preconditions for a successful publication. Unfortunately, listing all of the contributors would be difficult: we had a lot of supporters, and we will likely and unintentionally forget some of them. So we prepared another 'towing game': you will find all of our supporters by towing together the letters in the following letter grid. Have fun!:-)
