Abbreviations

Abbreviations of general terms

AGE	applied general equilibrium
ASEAN	Association of Southeast Asian Nations
CES	constant elasticity of substitution
CET	constant elasticity of transformation
CGE	computable general equilibrium
CSV	comma-separated value
EV	equivalent variation
GAMS	General Algebraic Modeling System
GAMS IDE	GAMS Integrated Development Environment
GATT	General Agreement on Tariffs and Trade
GDP	gross domestic product
GDX	GAMS Data Exchange
GTAP	Global Trade Analysis Project
IFPRI	International Food Policy Research Institute
IO	input–output
IRTS	increasing returns to scale
MDGs	millennium development goals
MFA	Multi-Fibre Arrangement
ROW	rest of the world
SAM	social accounting matrix
TOT	terms of trade
WTO	World Trade Organization

Abbreviations in social accounting matrices and GAMS input and output files

AGR	agriculture
BRD	bread
CAP	capital
EXT	external
EPS	epsilon, i.e., a small value close to zero
EQU	equation
GOV	government
HOH	household

IDT	indirect tax
INF	infinity
INV	investment
JPN	Japan
LAB	labour
MAN	manufacturing
MLK	milk
SRV	service
TRF	tariff
USA	the United States
VAR	variable

Symbols in CGE Models

Symbols indicating indices

- i, j : goods and firms (BRD, MLK),
 h, k : factors (CAP, LAB),
 l : households (HOH1, HOH2),
 r, rr : regions (JPN, USA).

Symbols in Chapter 2

[Endogenous variables]

- UU : utility,
 X_i : consumption of the i -th good,
 Z_j : output of the j -th firm,
 $F_{h,j}$: the h -th factor used by the j -th firm,
 p_i^x : demand price of the i -th good,
 p_j^s : supply price of the j -th good,
 p_h^f : price of the h -th factor.

[Exogenous variables and constants]

- FF_h : endowments of the h -th factor for the household,
 α_i : share coefficient for the i -th good consumption in the utility function,
 $\beta_{h,j}$: share coefficient for the h -th factor used by the j -th firm in the production function,
 b_j : scaling coefficient in the production function.

Symbols in Chapter 6

[Endogenous variables]

- UU : utility,
 Y_j : composite factor, produced in the first stage and used in the second stage by the j -th firm,
 $F_{h,j}$: the h -th factor used by the j -th firm in the first stage,
 $X_{i,j}$: intermediate input of the i -th good used by the j -th firm,
 Z_j : gross domestic output of the j -th firm,
 X_i^p : household consumption of the i -th good,

X_i^g :	government consumption of the i-th good,
X_i^v :	demand for the i-th investment good,
E_i :	exports of the i-th good,
M_i :	imports of the i-th good,
Q_j :	the i-th Armington composite good,
D_i :	the i-th domestic good,
p_j^v :	price of the j-th composite factor,
p_h^f :	price of the h-th factor,
p_j^g :	price of the j-th gross domestic output,
p_i^e :	price of the i-th exported good,
p_i^m :	price of the i-th imported good,
p_i^q :	price of the i-th composite good,
p_i^d :	price of the i-th domestic good,
ε :	foreign exchange rate (domestic currency/foreign currency),
S^p :	household savings,
S^g :	government savings,
T^d :	direct tax,
T_j^z :	production tax on the j-th good,
T_i^m :	import tariff on the i-th good.

[Exogenous variables and constants]

FF_h :	endowments of the h-th factor for the household,
p_i^{we} :	price of the i-th exported good in terms of foreign currency,
p_i^{wm} :	price of the i-th imported good in terms of foreign currency,
S^f :	current account deficits in foreign currency terms (or equivalently foreign savings),
τ^d :	direct tax rate,
τ_j^z :	production tax rate on the j-th good,
τ_i^m :	import tariff rate on the i-th good,
$ax_{i,j}$:	input requirement coefficient of the i-th intermediate input for a unit output of the j-th good,
ay_j :	input requirement coefficient of the j-th composite good for a unit output of the j-th good,
α_i :	share coefficient for the i-th good consumption in the utility function,
$\beta_{h,j}$:	share coefficient for the h-th factor used by the j-th firm in the composite factor production function,
b_j :	scaling coefficient in the j-th composite factor production function,
μ_i :	share of the i-th good in government expenditure,

λ_i :	expenditure share of the i-th good in total investment,
ss^p :	average propensity for savings by the household,
ss^g :	average propensity for savings by the government,
γ_i :	scaling coefficient in the i-th Armington composite good production function,
$\delta m_i, \delta d_i$:	input share coefficients in the i-th Armington composite good production function,
η_i :	parameter defined by the elasticity of substitution,
σ_i :	elasticity of substitution in the i-th Armington composite good production function,
θ_i :	scaling coefficient in the i-th good transformation function,
$\xi e_i, \xi d_i$:	share coefficients in the i-th good transformation function,
ϕ_i :	parameter defined by the elasticity of transformation,
ψ_i :	elasticity of transformation in the i-th good transformation function.

Symbols in Chapter 10 (selective)

SW :	social welfare,
RT_i :	monopoly or quota rents in the i-th sector,
χ_i :	quota rent rate in the i-th sector,
M_i^{quota} :	quota ceiling on the i-th good imports,
FC_j :	fixed production costs of the j-th firm,
v_j :	the share of the fixed cost payment to the household in total capital service payment by the j-th firm.

Preface

Computable general equilibrium (CGE) models are well grounded in standard microeconomic theory, where price is an important signal that drives agents in an economy. The modern economy cannot be examined without considering the role of the price mechanism. CGE models featuring the price mechanism are suitable for analysing contemporary policy issues in market economies and thus are used widely in various policy analyses, such as economic integration, global warming problems, tax reform, assistance for developing countries and so on. The potential of CGE models has encouraged many researchers and practitioners to cooperate in the development and use of these models; however, many of them have had difficulty in fully understanding CGE models, because of the complexity of the underlying economic theory, estimation techniques and computational requirements – this is why CGE models are sometimes called a ‘black box’.

Despite the usefulness of CGE models, they have been used only infrequently in Japan. This is partly because, although many useful books and articles on CGE modelling are available in English, there were no comprehensive textbooks in Japanese, particularly for newcomers to CGE modelling. Therefore, we decided to write this textbook on CGE modelling in Japanese several years ago. Our endeavour resulted in the publication of *Textbook of Computable General Equilibrium Modeling – Programming and Simulations* by the University of Tokyo Press in 2004.

In the Japanese version of the textbook, we made considerable effort to help beginners to understand and build CGE models by themselves. The textbook was designed to be self-inclusive, proceeding in a step-by-step manner. We covered the A-to-Z of CGE modelling, starting from a basic setup of economic agents’ behaviour, construction of databases, estimation of model parameters, computer programs and interpretation of simulation results. In each step, sample models with computer programs were presented.

The computer programs were written using the GAMS (General Algebraic Modeling System) software, whose trial version is publicly accessible on the GAMS web site free of charge. Assuming that most readers of this book were completely new to GAMS, we presented a detailed explanation of its use in the book. It was intended that, as readers become familiar with GAMS, they would be able to use the sample models on

the GAMS web site and to become acquainted with CGE models by experimenting with these sample models.

After the publication of our textbook in Japanese, we received requests from both international students studying in Japan and researchers in other countries to publish an English version. These requests motivated us to publish this book. In this English version, we retain the features of the Japanese version outlined above. At the same time, the English version is not a mere English translation. On the one hand, considerable effort has been made to improve the clarity of the explanation and to include recent changes to GAMS and data for CGE modelling. On the other hand, we omitted several sections that were specifically written for Japanese readers; in particular, actual examples of CGE analyses.

Partly because this textbook is written for beginners, and partly because of space limitations, this textbook covers only the basic features of CGE modelling. For example, we have not discussed dynamics or the monetary economy, which are discussed in other advanced books and journal articles about CGE models. After reading through this textbook, readers can start to explore such frontiers of CGE modelling. While we are confident that this book provides readers with all the essential knowledge and techniques of CGE modelling, we would appreciate any comments and suggestions that may improve this book.

We gratefully acknowledge useful comments and suggestions by Professors Kanemi Ban and Tatsuo Hatta, and by many friends, as well as readers of the Japanese version. In the publication of the Japanese version, we acknowledged Messrs Takuya Kuroda and Toshihiro Ikeda at the University of Tokyo Press for their assistance. We thank the University of Tokyo Press for providing permission to publish this English version. Regarding the software used for the modelling discussed in this book, we are indebted to Mr Alex Meeraus and his associates in GAMS Development Corporation for their generous support of our use of GAMS in both the Japanese and English versions of our book. The use of GAMS throughout this book allows us to provide a practical introduction to CGE modelling. We gratefully acknowledge the financial support of a Grant-in-Aid for Scientific Research (No. 20330053, 21730222) by the Ministry of Education, Culture, Sports, Science and Technology of Japan and the Japan Society for the Promotion of Science. We also acknowledge MIT Press and Elsevier for granting us permission to reprint certain figures originally contained in their publications, and Microsoft Corporation and GAMS Development Corporation for granting us permission to use screen shots of their products.

Contents

<i>Abbreviations</i>	x
<i>Symbols in CGE Models</i>	xii
<i>Tables, Figures and Lists</i>	xv
<i>Preface</i>	xviii
1 Overview	1
1.1 Economic analysis with computable general equilibrium models	1
1.2 Framework of CGE models	3
1.3 Advantages and shortcomings of CGE models	5
1.4 Applications of CGE models	6
1.5 Aims of this book	6
1.6 Software and simulations on the PC	8
1.7 Structure of this textbook	10
2 The Simple CGE Model	13
2.1 Setup of the economy	14
2.2 Household behaviour	15
2.3 Firm behaviour	16
2.4 Market-clearing conditions	18
2.5 Model system	19
3 Computation	23
3.1 Example: the ‘household utility maximization model’	23
3.1.1 Formulation of the model	24
3.1.2 Specifying coefficients and exogenous variables	25
3.2 Computational procedures	25
3.3 Preparing input files	27
3.3.1 Structure of input files and general syntax of GAMS	27
3.3.2 Directives	29
3.4 Results of computation in the output file	36

4 The Social Accounting Matrix	41
4.1 Structure of social accounting matrix	42
4.1.1 Social accounting matrix for the simple CGE model	42
4.1.2 SAM for the standard CGE model	44
4.2 Construction of social accounting matrix	47
4.3 Example: Social accounting matrix for Japan	50
4.4 Consistency among various databases and matrix adjustment for a SAM	56
 5 Calibration and Computational Strategy for General Equilibrium	 61
5.1 The basic concept of calibration	61
5.2 Value, price and quantity	63
5.3 Calibration procedure – mathematical manipulation	64
5.3.1 The case without indirect taxes	64
5.3.2 The case with indirect taxes	69
5.4 GAMS programming	70
5.4.1 Programming procedures and an input file	70
5.4.2 Declaration and definition of sets	73
5.4.3 Installation of the SAM	74
5.4.4 Retrieval of data from the SAM	75
5.4.5 Calibration	76
5.4.6 Specifying and solving the CGE model	78
5.4.7 Initial values for numerical computation	78
5.4.8 Uses of lower bounds	79
5.4.9 Choice of numeraire	80
5.5 Solution of the simple CGE model	80
 6 The Standard CGE Model	 87
6.1 Overview of the standard CGE model	87
6.2 Intermediate inputs	89
6.3 Government	92
6.4 Investment and savings	93
6.4.1 Introduction of investment and savings	93
6.4.2 Modification of household and government behaviour	95

6.5	International trade	96
6.5.1	Small-country assumption and balance of payments	96
6.5.2	Armington's assumption	97
6.5.3	Substitution between imports and domestic goods	98
6.5.4	Transformation between exports and domestic goods	99
6.6	Market-clearing conditions	102
6.7	Model system	103
6.8	GAMS programming	106
6.8.1	Declaration of sets, installation of the SAM and derivation of the initial equilibrium values	112
6.8.2	Calibration	114
6.8.3	Model solution	118
7	Macro Closure	122
7.1	Investment and savings – macro closure in a closed economy model	123
7.2	Current account balance – macro closure in an open economy model	125
7.3	Other closure rules	127
8	Simulating General Equilibria	128
8.1	Multiple runs in one input file	129
8.2	Computation of indicators from solved values	131
8.3	Measurement of economic welfare	133
8.4	Sensitivity analysis	137
8.4.1	The concept of sensitivity analysis	137
8.4.2	Example of sensitivity analysis with the standard CGE model	138
8.4.3	Sensitivity analysis with a three-sector model	139
9	Interpretation of Simulation Results	144
9.1	One-sector model	145
9.1.1	A small open economy	145
9.1.2	Impact of import tariffs	149

9.1.3	Impact of transfers from abroad	151
9.1.4	Impact of terms of trade shock	152
9.2	Two-sector model	153
10	Model Extension	158
10.1	Multihousehold model	158
10.2	Large-country model	161
10.3	World trade model	167
10.3.1	Two-country model	167
10.3.2	Multicountry model	174
10.4	Imperfect competition model	176
10.4.1	Monopoly model	176
10.4.2	Oligopoly model	182
10.5	Quantitative restrictions	182
10.6	Increasing-returns-to-scale model	187
11	Concluding Remarks	191
11.1	Extensions inside the CGE models	191
11.2	Extensions outside the CGE models	192
11.3	Concluding remarks for better CGE modelling	193
<i>Appendix I: Derivation of Household Demand Functions</i>		195
<i>Appendix II: Competitive Equilibrium vs Social Optimum</i>		196
<i>Appendix III: Utility Maximization and Lagrange Multipliers</i>		199
<i>Appendix IV: Reformulation of a System of Simultaneous Equations into an Optimization Problem</i>		200
<i>Appendix V: Leontief-type Function and Optimization</i>		202
<i>Annex A: Advanced Uses of GAMS</i>		204
A.1	Set	204
A.1.1	Sequence in a set	204
A.1.2	Alias of a set	204
A.1.3	Subset	205
A.2	Setting values with formula	205
A.3	Large Table data input	206
