About the Authors

Thomas Engel has taught chemistry at the University of Washington for more than 20 years, where he is Professor Emeritus of Chemistry. Professor Engel received his bachelor's and master's degrees in chemistry from the Johns Hopkins University, and his Ph.D. in chemistry from the University of Chicago. He then spent 11 years as a researcher in Germany and Switzerland, in which time he received the Dr. rer. nat. habil. degree from the Ludwig Maximilians University in Munich. In 1980, he left the IBM research laboratory in Zurich to become a faculty member at the University of Washington.

Professor Engel's research interests are in the area of surface chemistry, and he has published more than 80 articles and book chapters in this field. He has received the Surface Chemistry of Colloids Award from the American Chemical Society and a Senior Humboldt Research Award from the Alexander von Humboldt Foundation. When not writing, he is likely to be hiking, sea kayaking, or cross-country skiing.

Gary Drobny has taught chemistry at the University of Washington since he joined the chemistry faculty in 1985. Professor Drobny received his bachelor's degree in chemistry from San Francisco State University in 1976, and his Ph.D. in chemistry in 1981 from the University of California at Berkeley.

Professor Drobny's interests are in the areas of solution and solid-state nuclear magnetic resonance, protein-nucleic acid recognition, biomaterials, biomineralization, and structural studies of proteins at biomaterial interfaces. He has published more than 120 articles in these fields.

Philip Reid has taught chemistry at the University of Washington since he joined the chemistry faculty in 1995. Professor Reid received his bachelor's degree from the University of Puget Sound in 1986, and his Ph.D. in chemistry from the University of California at Berkeley in 1992. He performed postdoctoral research at the University of Minnesota, Twin Cities, campus before moving to Washington.

Professor Reid's research interests are in the areas of atmospheric chemistry, condensed-phase reaction dynamics, and nonlinear optical materials. He has published more than 90 articles in these fields. Professor Reid is the recipient of a CAREER award from the National Science Foundation, is a Cottrell Scholar of the Research Corporation, and is a Sloan fellow. He received the Distinguished Teaching Award from the University of Washington in 2005 for his contributions to undergraduate education.

Preface

This book grew out of our experience in teaching physical chemistry to undergraduate students majoring in chemistry, biochemistry, and the biological sciences. The following objectives, illustrated with brief examples, outline the distinctive features of this book:

- **Focus on teaching core concepts.** The central principles of physical chemistry are explored by focusing on core ideas, and then extending these ideas to a variety of problems. For example, the Gibbs energy, bioenergetics, and chemical equilibrium are at the heart of thermodynamics and are explored in depth in this text. Similarly, a very good understanding of quantum mechanics can be obtained from a few basic systems: the particle in a box, the harmonic oscillator, and the hydrogen atom. Therefore, care is taken to fully explain and develop these key systems in order to provide a solid foundation for the student. A similar approach has been taken in other areas of physical chemistry. The goal is to build a solid foundation of student understanding rather than cover a wide variety of topics in modest detail.
- **Illustrate the relevance of physical chemistry to the world around us.** Many students struggle to connect physical chemistry concepts to the world around them. To address this issue, example problems and specific topics are tied together to help the student develop this connection. Biological membranes and the energetics of ion transport are discussed in a chapter focused on bioenergetics. Fuel cells, refrigerators, and heat pumps are discussed in connection with the second law of thermodynamics. Glycolysis, the Krebs cycle, and the electron transport chain are discussed in a chapter on biochemical equilibria.
- **Demonstrate the importance of quantum mechanics in the biological sciences.** Many everyday phenomena cannot be understood without quantum mechanics. The particle-in-a-box model is used to explain why metals conduct electricity and why valence electrons rather than core electrons are important in chemical bond formation. The real-world applications of quantum mechanics are in chemical spectroscopy. In-depth discussions of structural determinations of biomolecules using multidimensional NMR, the use of Raman spectroscopy to image living cells with chemical specificity, the use of fluorescence spectroscopy to sequence the human genome, and the use of fluorescence resonance energy transfer (FRET) as a spectroscopic ruler to measure donor–acceptor distances show the student the importance of having a solid foundation in quantum mechanics.
- **Present exciting new science in the field of physical chemistry.** Physical chemistry lies at the forefront of many emerging areas of modern chemical research. Examples discussed in this text include the use of atomic force microscopy to obtain nanometer-scale structural information about biological systems *in situ* and in real time, the use of single-molecule spectroscopy to understand kinetics at a molecular level, the use of FRET to determine the magnitude of the structural change introduced by substrate binding to an enzyme, and the use of multidimensional NMR to determine biomolecular structures in solution.

- **Use Web-based simulations to illustrate the concepts being explored and avoid math overload.** Mathematics is central to physical chemistry; however, the mathematics can distract the student from “seeing” the underlying concepts. To circumvent this problem, Web-based simulations have been incorporated as end-of-chapter problems throughout the book so that the student can focus on the science and avoid a math overload. These Web-based simulations can also be used by instructors during lectures. More than 50 such Web-based problems are available on the course Web site. An important feature is that each problem has been designed as an assignable exercise with a printable answer sheet that the student can submit to the instructor. The course Web site also includes a graphing routine with a curve-fitting capability, which allows students to print and submit graphical data.
- **Show that learning problem-solving skills is an essential part of physical chemistry.** Many example problems are worked through in each chapter. The end-of-chapter problems cover a range of difficulties suitable for students at all levels. Conceptual questions at the end of each chapter ensure that students learn to express their ideas in the language of science.
- **Use color to make learning physical chemistry more interesting.** Color is used to enhance both the pedagogy and content of the text. For example, four-color images are used to enhance the understanding of biochemical cycles, to display atomic and molecular orbitals both quantitatively and attractively, and to make complex images such as multidimensional NMR spectra understandable.

This text contains more material than can be covered in a one- or two-semester course, and this is entirely intentional. Effective use of the text does not require one to proceed sequentially through the chapters, or to include all sections. Many sections are self-contained so that they can be readily omitted if they do not serve the needs of the instructor. The text is constructed to be flexible to your needs, not the other way around. We welcome the comments of both students and instructors on how the material was used and on how the presentation can be improved.

Acknowledgments

Many individuals have helped us to bring the text into its current form. Students have provided us with feedback directly and through the questions they have asked, which has helped us to understand how they learn. We especially thank our colleagues at the University of Washington including Rachel Klevit, Mickey Schurr, and Gabriele Varani who contributed valuable advice about biological NMR spectroscopy and transport. The help of Nicholas Breen, Gil Goobes, and Dirk Stueber, who reviewed Chapter 20, is also gratefully acknowledged. The help of William Parson and Ronald Stenkamp in critically reading Chapter 21 has been invaluable. Our own approach to thermodynamics and statistical thermodynamics has been influenced by the excellent textbooks of Lennard Nash and Gilbert Castellan. The biologically oriented physical chemistry texts by Eisenberg and Crothers and Tinoco, Sauer, Wang, and Puglisi influenced some of our approaches to topics in transport and spectroscopy. We are also fortunate to have access to some end-of-chapter problems that were written by Joseph Noggle and Gilbert Castellan in their physical chemistry textbooks. The reviewers, who are listed separately, have made many suggestions for improvement, for which we are very grateful. All those involved in the production process have helped to make this book a reality through their efforts. Special thanks are due to Jim Smith, who helped us initiate this project, and to Katie Conley and Jeff Howard who have guided the production process.

CHAPTER 1

Fundamental Concepts of Thermodynamics 1

1.1 What Is Thermodynamics and Why Is It Useful? 1
1.2 Basic Definitions Needed to Describe Thermodynamic Systems 2
1.3 Thermometry 4
1.4 Equations of State and the Ideal Gas Law 6
1.5 A Brief Introduction to Real Gases 9

CHAPTER 2

Heat, Work, Internal Energy, Enthalpy, and the First Law of Thermodynamics 15

2.1 The Internal Energy and the First Law of Thermodynamics 15
2.2 Work 16
2.3 Heat 19
2.4 Heat Capacity 21
2.5 State Functions and Path Functions 23
2.6 Equilibrium, Change, and Reversibility 25
2.7 Comparing Work for Reversible and Irreversible Processes 26
2.8 Determining ΔU and Introducing Enthalpy, a New State Function 31
2.9 Calculating q , w , ΔU , and ΔH 31
2.10 The Reversible Adiabatic Expansion and Compression of an Ideal Gas 36

CHAPTER 3

The Importance of State Functions: Internal Energy and Enthalpy 43

3.1 The Mathematical Properties of State Functions 43
3.2 The Dependence of U on V and T 47
3.3 Does the Internal Energy Depend More Strongly on V or T ? 49

3.4 The Variation of Enthalpy with Temperature at Constant Pressure 53
3.5 How Are C_p and C_v Related? 55
3.6 The Variation of Enthalpy with Pressure at Constant Temperature 56
3.7 The Joule–Thomson Experiment 58

CHAPTER 4

Thermochemistry 63

4.1 Energy Stored in Chemical Bonds Is Released or Taken Up in Chemical Reactions 63
4.2 Internal Energy and Enthalpy Changes Associated with Chemical Reactions 64
4.3 Hess's Law Is Based on Enthalpy Being a State Function 68
4.4 The Temperature Dependence of Reaction Enthalpies 70
4.5 The Experimental Determination of ΔU and ΔH for Chemical Reactions 72
4.6 Differential Scanning Calorimetry 75

CHAPTER 5

Entropy and the Second and Third Laws of Thermodynamics 81

5.1 The Universe Has a Natural Direction of Change 81
5.2 Heat Engines and the Second Law of Thermodynamics 82
5.3 Introducing Entropy 87
5.4 Calculating Changes in Entropy 88
5.5 Using Entropy to Calculate the Natural Direction of a Process in an Isolated System 93
5.6 The Clausius Inequality 95
5.7 The Change of Entropy in the Surroundings and $\Delta S_{total} = \Delta S + \Delta S_{surroundings}$ 96
5.8 Absolute Entropies and the Third Law of Thermodynamics 98
5.9 Standard States in Entropy Calculations 102
5.10 Entropy Changes in Chemical Reactions 102
5.11 Refrigerators, Heat Pumps, and Real Engines 104

CHAPTER 6

The Gibbs Energy and Chemical Equilibrium 113

- 6.1 The Gibbs Energy and the Helmholtz Energy 113
- 6.2 The Differential Forms of U , H , A , and G 117
- 6.3 The Dependence of the Gibbs and Helmholtz Energies on P , V , and T 118
- 6.4 The Gibbs Energy of a Mixture 122
- 6.5 The Gibbs Energy of a Gas in a Mixture 123
- 6.6 Calculating the Gibbs Energy of Mixing for Ideal Gases 124
- 6.7 Expressing Chemical Equilibrium in Terms of the μ_i 125
- 6.8 Calculating $\Delta G_{\text{reaction}}$ and Introducing the Equilibrium Constant for a Mixture of Ideal Gases 128
- 6.9 Calculating the Equilibrium Partial Pressures in a Mixture of Ideal Gases 130
- 6.10 The Variation of K_p with Temperature 131
- 6.11 Equilibria Involving Ideal Gases and Solid or Liquid Phases 133
- 6.12 Expressing the Equilibrium Constant in Terms of Mole Fraction or Molarity 134
- 6.13 The Dependence of ξ_{eq} on T and P 135

CHAPTER 7

Phase Equilibria 141

- 7.1 What Determines the Relative Stability of the Solid, Liquid, and Gas Phases? 141
- 7.2 The Pressure–Temperature Phase Diagram 143
- 7.3 Biological Impact of the Thermal Properties of Water 147
- 7.4 Providing a Theoretical Basis for the P – T Phase Diagram 150
- 7.5 Using the Clapeyron Equation to Calculate Vapor Pressure as a Function of T 151
- 7.6 Surface Tension 153
- 7.7 Amphiphilic Molecules and the Hydrophobic Effect 157
- 7.8 Lipid Bilayers and Biological Membranes 159
- 7.9 Surface Films of Amphiphiles 161
- 7.10 Conformational Transitions of Biological Polymers 164

CHAPTER 8

Ideal and Real Solutions 175

- 8.1 Defining the Ideal Solution 175
- 8.2 The Chemical Potential of a Component in the Gas and Solution Phases 177
- 8.3 Applying the Ideal Solution Model to Binary Solutions 178
- 8.4 The Temperature–Composition Diagram and Fractional Distillation 182
- 8.5 The Gibbs–Duhem Equation 184
- 8.6 Colligative Properties 185
- 8.7 The Freezing Point Depression and Boiling Point Elevation 186
- 8.8 The Osmotic Pressure 188

- 8.9 Real Solutions Exhibit Deviations from Raoult's Law 193
- 8.10 The Ideal Dilute Solution 196
- 8.11 Activities Are Defined with Respect to Standard States 198
- 8.12 Henry's Law and the Solubility of Gases in a Solvent 202
- 8.13 Chemical Equilibrium in Solutions 205

CHAPTER 9

Electrolyte Solutions, Electrochemical Cells, and Redox Reactions 211

- 9.1 The Enthalpy, Entropy, and Gibbs Energy of Ion Formation in Solutions 211
- 9.2 Understanding the Thermodynamics of Ion Formation and Solvation 214
- 9.3 Activities and Activity Coefficients for Electrolyte Solutions 216
- 9.4 Calculating γ_{\pm} Using the Debye–Hückel Theory 218
- 9.5 Chemical Equilibrium in Electrolyte Solutions 222
- 9.6 The Electrochemical Potential 223
- 9.7 Electrochemical Cells and Half-Cells 225
- 9.8 Redox Reactions in Electrochemical Cells and the Nernst Equation 228
- 9.9 Combining Standard Electrode Potentials to Determine the Cell Potential 230
- 9.10 The Relationship Between the Cell emf and the Equilibrium Constant 232
- 9.11 The Determination of E° and Activity Coefficients Using an Electrochemical Cell 233
- 9.12 The Biochemical Standard State 234
- 9.13 The Donnan Potential 237

CHAPTER 10

Principles of Biochemical Thermodynamics 245

- 10.1 Thermodynamics and Living Systems 245
- 10.2 The Principle of Common Intermediates 248
- 10.3 Phosphate Transfer Potentials 250
- 10.4 Biological Membranes and the Energetics of Ion Transport 253
- 10.5 Thermodynamics of Adenosine Triphosphate Hydrolysis 257

CHAPTER 11

Biochemical Equilibria 265

- 11.1 Bioenergetics Overview 265
- 11.2 Glycolysis 268
- 11.3 The Krebs Cycle 272
- 11.4 The Electron Transport Chain 277
- 11.5 Oxidative Phosphorylation 281
- 11.6 Overview of Binding Equilibria 284
- 11.7 Independent Site Binding 286
- 11.8 Cooperative Site Binding 288
- 11.9 Protein Allostereism 290
- 11.10 Isothermal Titration Calorimetry 295

CHAPTER 12

From Classical to Quantum Mechanics 299

- 12.1 Why Study Quantum Mechanics? 299
- 12.2 Quantum Mechanics Arose Out of the Interplay of Experiments and Theory 300
- 12.3 Blackbody Radiation 300
- 12.4 The Photoelectric Effect 302
- 12.5 Particles Exhibit Wave-Like Behavior 304
- 12.6 Diffraction by a Double Slit 304
- 12.7 Atomic Spectra 307

CHAPTER 13

The Schrödinger Equation 311

- 13.1 What Determines If a System Needs to Be Described Using Quantum Mechanics? 311
- 13.2 Classical Waves and the Nondispersive Wave Equation 315
- 13.3 Quantum Mechanical Waves and the Schrödinger Equation 319
- 13.4 Quantum Mechanics and Experimental Measurements 319
- 13.5 The Solutions of the Schrödinger Equation Are Orthogonal 321

CHAPTER 14

Using Quantum Mechanics on Simple Systems: The Free Particle, the Particle in a Box, and the Harmonic Oscillator 327

- 14.1 The Free Particle 327
- 14.2 The Heisenberg Uncertainty Principle 329
- 14.3 The Particle in a One-Dimensional Box 331
- 14.4 Two- and Three-Dimensional Boxes 335
- 14.5 The Particle in the Finite Depth Box 336
- 14.6 Differences in Overlap between Core and Valence Electrons 337
- 14.7 Pi Electrons in Conjugated Molecules Can Be Treated as Moving Freely in a Box 338
- 14.8 Why Does Sodium Conduct Electricity and Why Is Diamond an Insulator? 339
- 14.9 Tunneling through a Barrier 340
- 14.10 The Scanning Tunneling Microscope 341
- 14.11 Tunneling in Chemical Reactions 344
- 14.12 Quantum Dots 346
- 14.13 The Quantum Mechanical Harmonic Oscillator 348

CHAPTER 15

The Hydrogen Atom and Many-Electron Atoms 357

- 15.1 Formulating the Schrödinger Equation for the Hydrogen Atom 357
- 15.2 Eigenvalues and Eigenfunctions for the Total Energy 358

- 15.3 The Hydrogen Atom Orbitals 363
- 15.4 The Radial Probability Distribution Function 365
- 15.5 The Validity of the Shell Model of an Atom 369
- 15.6 Helium: The Smallest Many-Electron Atom 370
- 15.7 Electron Spin Adds a Fourth Quantum Number 372
- 15.8 The Hartree–Fock Self-Consistent Field Method 374
- 15.9 Understanding Trends in the Periodic Table from Hartree–Fock Calculations 377

CHAPTER 16

Chemical Bonding in Diatomic Molecules 384

- 16.1 The Simplest One-Electron Molecule: H_2^+ 384
- 16.2 The Molecular Wave Function for Ground-State H_2^+ 385
- 16.2 A Closer Look at the Molecular Wave Functions ψ_g and ψ_u 388
- 16.4 The H_2 Molecule: Molecular Orbital and Valence Bond Models 390
- 16.5 Comparing the Valence Bond and Molecular Orbital Models of the Chemical Bond 392
- 16.6 Expressing Molecular Orbitals as a Linear Combination of Atomic Orbitals 393
- 16.7 The Molecular Orbital Energy Diagram 394
- 16.8 Molecular Orbitals for Homonuclear Diatomic Molecules 395
- 16.9 The Electronic Structure of Many-Electron Molecules 400
- 16.10 Bond Order, Bond Energy, and Bond Length 402
- 16.11 Heteronuclear Diatomic Molecules 404
- 16.12 The Molecular Electrostatic Potential 406

CHAPTER 17

Molecular Structure and Energy Levels for Polyatomic Molecules 411

- 17.1 Lewis Structures and the VSEPR Model 411
- 17.2 Describing Localized Bonds Using Hybridization for Methane, Ethene, and Ethyne 414
- 17.3 Constructing Hybrid Orbitals for Nonequivalent Ligands 417
- 17.4 Using Hybridization to Describe Chemical Bonding 418
- 17.5 Predicting Molecular Structure Using Molecular Orbital Theory 419
- 17.6 Dispersion Forces Act between Nonbonded Atoms and Molecules 423
- 17.7 Hydrogen Bonding 424

CHAPTER 18

Vibrational and Rotational Spectroscopy 428

- 18.1 An Introduction to Spectroscopy 428
- 18.2 Absorption, Spontaneous Emission, and Stimulated Emission 430
- 18.3 Basics of Vibrational Spectroscopy 432

- 18.4** The Origin of Selection Rules 435
18.5 Rotational Energy Levels and Bond Lengths 437
18.6 Infrared Absorption Spectroscopy in the Gas Phase 438
18.7 Vibrational Spectroscopy of Polypeptides in Solution 441
18.8 Basics of Raman Spectroscopy 442
18.9 Using Raman Spectroscopy to Image Living Cells with Chemical Specificity 445

CHAPTER 19

Electronic Spectroscopy 451

- 19.1** The Essentials of Atomic Spectroscopy 451
19.2 Analytical Techniques Based on Atomic Spectroscopy 453
19.3 The Doppler Effect 454
19.4 The Helium-Neon Laser 455
19.5 The Energy of Electronic Transitions in Molecules 458
19.6 The Franck–Condon Principle 458
19.7 UV-Visible Light Absorption in Polyatomic Molecules 460
19.8 Transitions among the Ground and Excited States 463
19.9 Singlet–Singlet Transitions: Absorption and Fluorescence 464
19.10 Intersystem Crossing and Phosphorescence 465
19.11 Fluorescence Spectroscopy and Analytical Chemistry 466
19.12 Single-Molecule Spectroscopy 467
19.13 Fluorescence Resonance Energy Transfer (FRET) 468
19.14 Linear and Circular Dichroism 472

CHAPTER 20

Nuclear Magnetic Resonance Spectroscopy 479

- 20.1** Nuclear Spins in External Fields 479
20.2 Transient Response and Relaxation 484
20.3 The Spin–Echo 486
20.4 Fourier Transform NMR Spectroscopy 488
20.5 NMR Spectra: Chemical Shifts and Spin–Spin Couplings 489
20.6 Multidimensional NMR 498
20.7 Solution NMR Studies of Biomolecules 505
20.8 Solid-State NMR and Biomolecular Structure 509
20.9 NMR Imaging 513
20.10 Electron Spin Resonance Spectroscopy 514

CHAPTER 21

The Structure of Biomolecules at the Nanometer Scale: X-Ray Diffraction and Atomic Force Microscopy 521

- 21.1** Unit Cells and Bravais Lattices 521
21.2 Lattice Planes and Miller Indices 524

- 21.3** The von Laue and Bragg Equations for X-Ray Diffraction 527
21.4 The Unit Cell Parameters Can Be Determined from a Diffraction Pattern 530
21.5 The Electron Distribution in the Unit Cell Can Be Calculated from the Structure Factor 531
21.6 Solutions to the Phase Problem 535
21.7 Structure Determinations Are Crucial to Understanding Biochemical Processes 537
21.8 The Atomic Force Microscope 541
21.9 Measuring Adhesion Forces between Cells and Molecular Recognition Imaging Using the Atomic Force Microscope 543
21.10 Nanodissection Using the Atomic Force Microscope 545
21.11 The Atomic Force Microscope as a Probe of Surface Structure 545
21.12 Observing Biochemical Processes in Real Time Using the Atomic Force Microscope 547

CHAPTER 22

The Boltzmann Distribution 552

- 22.1** Microstates and Configurations 552
22.2 Derivation of the Boltzmann Distribution 558
22.3 Physical Meaning of the Boltzmann Distribution Law 564
22.4 The Definition of β 565

CHAPTER 23

Statistical Thermodynamics 573

- 23.1** The Canonical Ensemble 573
23.2 Relating Q to q for an Ideal Gas 575
23.3 Molecular Energy Levels 577
23.4 Translational Partition Function 578
23.5 Rotational Partition Function: Diatomics 580
23.6 Vibrational Partition Function 587
23.7 The Equipartition Theorem 592
23.8 Electronic Partition Function 593
23.9 Statistical Thermodynamics 595
23.10 Chemical Equilibrium 607
23.11 The Helix-Coil Transition 611

CHAPTER 24

Transport Phenomena 619

- 24.1** What Is Transport? 619
24.2 Mass Transport: Diffusion 620
24.3 The Time Evolution of a Concentration Gradient 623
24.4 Supplemental: Statistical View of Diffusion 625
24.5 Properties of Rigid Macromolecules in Solution 627
24.6 Supplemental: Properties of Flexible Macromolecules in Solution 633
24.7 Velocity and Equilibrium Sedimentation 636
24.8 Viscosity of Gases, Liquids, and Solutions 643
24.9 Viscometry 648
24.10 Electrophoresis 650

CHAPTER 25

Elementary Chemical Kinetics	658
25.1 Introduction to Kinetics	658
25.2 Reaction Rates	659
25.3 Rate Laws	661
25.4 Reaction Mechanisms	666
25.5 Integrated Rate Law Expressions	667
25.6 Supplemental: Numerical Approaches	672
25.7 Sequential First-Order Reactions	673
25.8 Parallel Reactions	679
25.9 Temperature Dependence of Rate Constants	681
25.10 Reversible Reactions and Equilibrium	682
25.11 Perturbation-Relaxation Methods	685
25.12 Potential Energy Surfaces	687
25.13 Diffusion-Controlled Reactions	689
25.14 Activated Complex Theory	691

CHAPTER 26

Complex Biological Reactions	701
26.1 Reaction Mechanisms and Rate Laws	701
26.2 The Preequilibrium Approximation	703
26.3 Catalysis	705
26.4 Enzyme Kinetics	707
26.5 Photochemistry and Photobiology	716
26.6 Electron Transfer	727

CHAPTER

Fundamental Concepts of Thermodynamics

CHAPTER OUTLINE

- 1.1 What Is Thermodynamics and Why Is It Useful?
- 1.2 Basic Definitions Needed to Describe Thermodynamic Systems
- 1.3 Thermometry
- 1.4 Equations of State and the Ideal Gas Law
- 1.5 A Brief Introduction to Real Gases

Thermodynamics provides a description of matter on a macroscopic scale. In this approach, matter is described in terms of bulk properties such as pressure, density, volume, and temperature. The basic terms employed in thermodynamics, such as system, surroundings, intensive and extensive variables, adiabatic and diathermal walls, equilibrium, temperature, and thermometry, are discussed in this chapter. The usefulness of equations of state, which relate the state variables of pressure, volume, and temperature, is also discussed for real and ideal gases.

1.1 What Is Thermodynamics and Why Is It Useful?

Thermodynamics is the branch of science that describes the behavior of matter and the transformation between different forms of energy on a **macroscopic scale** (i.e., the human scale and larger). Thermodynamics describes a system in terms of its bulk properties. Only a few such bulk property variables are needed to describe the system, and these variables are generally obtained via measurements. A thermodynamic description of matter does not make reference to its structure and behavior at the microscopic level. For example, 1 mol of gaseous water at a sufficiently low density is completely described by two of the three **macroscopic variables** of pressure, volume, and temperature. By contrast, the **microscopic scale** refers to dimensions on the order of the size of molecules. At the microscopic level, water is a dipolar triatomic molecule, H_2O , with a bond angle of 104.5° that forms a network of hydrogen bonds.

Given that the microscopic nature of matter is becoming increasingly well understood using theories such as quantum mechanics, why is a macroscopic science like thermodynamics relevant today? The need to approach problems from a macroscopic point of view may seem debatable. Indeed, an argument exists for describing physical problems from a microscopic point of view using quantum or classical mechanics, then deriving macroscopic properties statistically. Such a strategy, commonly called the “bottom-up” approach, is often justifiable in a field such as chemistry where nature is frequently investigated at the molecular level, but in many fields of engineering and biology, nature is not viewed exclusively in detail at the molecular level. In these cases, a “top-down” strategy is followed wherein macroscopic properties are investigated without reference to the underlying microscopic composition or mechanics of the system. Even if an engineer
