

A TREATISE ON
ELECTRICITY
AND
MAGNETISM

VOLUME II

Third Edition

A TREATISE
ON
ELECTRICITY AND MAGNETISM

BY
JAMES CLERK MAXWELL, M.A.

LL.D. EDIN., D.C.L., F.R.SS. LONDON AND EDINBURGH

HONORARY FELLOW OF TRINITY COLLEGE

AND LATE PROFESSOR OF EXPERIMENTAL PHYSICS IN THE UNIVERSITY OF CAMBRIDGE

VOL. II
THIRD EDITION

OXFORD UNIVERSITY PRESS
LONDON : GEOFFREY CUMBERLEGE

FIRST EDITION 1873
SECOND EDITION 1881

THIRD EDITION 1892; Reprinted 1904

REPRINTED LITHOGRAPHICALLY IN GREAT BRITAIN

BY LOWE & BRYDONE, PRINTERS, LTD., LONDON

FROM SHEETS OF THE THIRD EDITION

1937, 1946, 1955

CONTENTS

PART III.

MAGNETISM.

CHAPTER I.

ELEMENTARY THEORY OF MAGNETISM.

Art.		Page
371.	Properties of a magnet when acted on by the earth	1
372.	Definition of the axis of the magnet and of the direction of magnetic force	1
373.	Action of magnets on one another. Law of magnetic force ..	2
374.	Definition of magnetic units and their dimensions	3
375.	Nature of the evidence for the law of magnetic force	4
376.	Magnetism as a mathematical quantity	4
377.	The quantities of the opposite kinds of magnetism in a magnet are always exactly equal	4
378.	Effects of breaking a magnet	5
379.	A magnet is built up of particles each of which is a magnet ..	5
380.	Theory of magnetic 'matter'	6
381.	Magnetization is of the nature of a vector	7
382.	Meaning of the term 'Magnetic Polarization'	8
383.	Properties of a magnetic particle	8
384.	Definitions of Magnetic Moment, Intensity of Magnetization, and Components of Magnetization	9
385.	Potential of a magnetized element of volume	9
386.	Potential of a magnet of finite size. Two expressions for this potential, corresponding respectively to the theory of polariza- tion, and to that of magnetic 'matter'	10
387.	Investigation of the action of one magnetic particle on another	11
388.	Particular cases	13
389.	Potential energy of a magnet in any field of force	15
390.	On the magnetic moment and axis of a magnet	17

Art.		Page
391.	Expansion of the potential of a magnet in spherical harmonics	17
392.	The centre of a magnet and the primary and secondary axes through the centre	19
393.	The north end of a magnet in this treatise is that which points north, and the south end that which points south. Boreal magnetism is that which is supposed to exist near the north pole of the earth and the south end of a magnet. Austral magnetism is that which belongs to the south pole of the earth and the north end of a magnet. Austral magnetism is considered positive	20
394.	The direction of magnetic force is that in which austral magnetism tends to move, that is, from south to north, and this is the positive direction of magnetic lines of force. A magnet is said to be magnetized from its south end towards its north end	21

CHAPTER II.

MAGNETIC FORCE AND MAGNETIC INDUCTION.

395.	Magnetic force defined with reference to the magnetic potential	22
396.	Magnetic force in a cylindric cavity in a magnet uniformly magnetized parallel to the axis of the cylinder	23
397.	Application to any magnet	23
398.	An elongated cylinder.—Magnetic force	24
399.	A thin disk.—Magnetic induction	24
400.	Relation between magnetic force, magnetic induction, and magnetization	25
401.	Line-integral of magnetic force, or magnetic potential	25
402.	Surface-integral of magnetic induction	26
403.	Solenoidal distribution of magnetic induction	28
404.	Surfaces and tubes of magnetic induction	28
405.	Vector-potential of magnetic induction	29
406.	Relations between the scalar and the vector-potential	30

CHAPTER III.

MAGNETIC SOLENOIDS AND SHELLS.

407.	Definition of a magnetic solenoid	33
408.	Definition of a complex solenoid and expression for its potential at any point	34

CONTENTS.

vii

Art.		Page
409.	The potential of a magnetic shell at any point is the product of its strength multiplied by the solid angle its boundary subtends at the point	35
410.	Another method of proof	35
411.	The potential at a point on the positive side of a shell of strength Φ exceeds that on the nearest point on the negative side by $4\pi\Phi$	36
412.	Lamellar distribution of magnetism	36
413.	Complex lamellar distribution	37
414.	Potential of a solenoidal magnet	37
415.	Potential of a lamellar magnet	37
416.	Vector-potential of a lamellar magnet	38
417.	On the solid angle subtended at a given point by a closed curve	39
418.	The solid angle expressed by the length of a curve on the sphere	40
419.	Solid angle found by two line-integrations	40
420.	Π expressed as a determinant	41
421.	The solid angle is a cyclic function	42
422.	Theory of the vector-potential of a closed curve	43
423.	Potential energy of a magnetic shell placed in a magnetic field	45

CHAPTER IV.

INDUCED MAGNETIZATION.

424.	When a body under the action of magnetic force becomes itself magnetized the phenomenon is called magnetic induction	47
425.	Magnetic induction in different substances	49
426.	Definition of the coefficient of induced magnetization	50
427.	Mathematical theory of magnetic induction. Poisson's method	50
428.	Faraday's method	53
429.	Case of a body surrounded by a magnetic medium	55
430.	Poisson's physical theory of the cause of induced magnetism	57

CHAPTER V.

PARTICULAR PROBLEMS IN MAGNETIC INDUCTION.

431.	Theory of a hollow spherical shell	59
432.	Case when κ is large	61
433.	When $\epsilon = 1$	61
434.	Corresponding case in two dimensions. (Fig. XV)	62
435.	Case of a solid sphere, the coefficients of magnetization being different in different directions	63

Art.	Page
436. The nine coefficients reduced to six. (Fig. XVI)	64
437. Theory of an ellipsoid acted on by a uniform magnetic force ..	66
438. Cases of very flat and of very long ellipsoids	68
439. Statement of problems solved by Neumann, Kirchhoff, and Green	72
440. Method of approximation to a solution of the general problem when κ is very small. Magnetic bodies tend towards places of most intense magnetic force, and diamagnetic bodies tend to places of weakest force	73
441. On ship's magnetism	74

CHAPTER VI.

WEBER'S THEORY OF INDUCED MAGNETISM.

442. Experiments indicating a maximum of magnetization	79
443. Weber's mathematical theory of temporary magnetization ..	81
444. Modification of the theory to account for residual magnetization ..	85
445. Explanation of phenomena by the modified theory	87
446. Magnetization, demagnetization, and remagnetization	90
447. Effects of magnetization on the dimensions of the magnet ..	92
448. Experiments of Joule	93

CHAPTER VII.

MAGNETIC MEASUREMENTS.

449. Suspension of the magnet	95
450. Methods of observation by mirror and scale. Photographic method	96
451. Principle of collimation employed in the Kew magnetometer ..	101
452. Determination of the axis of a magnet and of the direction of the horizontal component of the magnetic force	101
453. Measurement of the moment of a magnet and of the intensity of the horizontal component of magnetic force	104
454. Observations of deflexion	107
455. Method of tangents and method of sines	109
456. Observation of vibrations	110
457. Elimination of the effects of magnetic induction	112
458. Statical method of measuring the horizontal force	114
459. Bifilar suspension	115
460. System of observations in an observatory	119
461. Observation of the dip-circle	120

Art.	Page
462. J. A. Broun's method of correction	123
463. Joule's suspension	124
464. Balance vertical force magnetometer	126

CHAPTER VIII.

ON TERRESTRIAL MAGNETISM.

465. Elements of the magnetic force	129
466. Combination of the results of the magnetic survey of a country ..	130
467. Deduction of the expansion of the magnetic potential of the earth in spherical harmonics	132
468. Definition of the earth's magnetic poles. They are not at the extremities of the magnetic axis. False poles. They do not exist on the earth's surface	132
469. Gauss' calculation of the 24 coefficients of the first four har- monics	133
470. Separation of external from internal causes of magnetic force ..	134
471. The solar and lunar variations	135
472. The periodic variations	135
473. The disturbances and their period of 11 years	135
474. Reflexions on magnetic investigations	136

PART IV.

ELECTROMAGNETISM.

CHAPTER I.

ELECTROMAGNETIC FORCE.

475. Ørsted's discovery of the action of an electric current on a magnet	138
476. The space near an electric current is a magnetic field	139
477. Action of a vertical current on a magnet	139
478. Proof that the force due to a straight current of indefinitely great length varies inversely as the distance	139
479. Electromagnetic measure of the current	140
480. Potential function due to a straight current. It is a function of many values	140

Art.	Page
481. The action of this current compared with that of a magnetic shell having an infinite straight edge and extending on one side of this edge to infinity	141
482. A small circuit acts at a great distance like a magnet	141
483. Deduction from this of the action of a closed circuit of any form and size on any point not in the current itself	142
484. Comparison between the circuit and a magnetic shell	142
485. Magnetic potential of a closed circuit	143
486. Conditions of continuous rotation of a magnet about a current	144
487. Form of the magnetic equipotential surface due to a closed circuit. (Fig. XVIII)	145
488. Mutual action between any system of magnets and a closed current	146
489. Reaction on the circuit	146
490. Force acting on a wire carrying a current and placed in the magnetic field	148
491. Theory of electromagnetic rotations	149
492. Action of one electric circuit on the whole or any portion of another	151
493. Our method of investigation is that of Faraday	151
494. Illustration of the method applied to parallel currents	152
495. Dimensions of the unit of current	152
496. The wire is urged from the side on which its magnetic action strengthens the magnetic force and towards the side on which it opposes it	153
497. Action of an infinite straight current on any current in its plane	153
498. Statement of the laws of electromagnetic force. Magnetic force due to a current	155
499. Generality of these laws	155
500. Force acting on a circuit placed in the magnetic field	156
501. Electromagnetic force is a mechanical force acting on the conductor, not on the electric current itself	157

CHAPTER II.

AMPÈRE'S INVESTIGATION OF THE MUTUAL ACTION OF ELECTRIC CURRENTS.

502. Ampère's investigation of the law of force between the elements of electric currents	158
503. His method of experimenting	159

Art.	Page
504. Ampère's balance	159
505. Ampère's first experiment. Equal and opposite currents neutralize each other	159
506. Second experiment. A crooked conductor is equivalent to a straight one carrying the same current	160
507. Third experiment. The action of a closed current as an element of another current is perpendicular to that element ..	161
508. Fourth experiment. Equal currents in systems geometrically similar produce equal forces	162
509. In all of these experiments the acting current is a closed one ..	163
510. Both circuits may, however, for mathematical purposes be conceived as consisting of elementary portions, and the action of the circuits as the resultant of the action of these elements	163
511. Necessary form of the relations between two elementary portions of lines	164
512. The geometrical quantities which determine their relative position	164
513. Form of the components of their mutual action	165
514. Resolution of these in three directions, parallel, respectively, to the line joining them and to the elements themselves ..	167
515. General expression for the action of a finite current on the element of another	167
516. Condition furnished by Ampère's third case of equilibrium ..	168
517. Theory of the directrix and the determinants of electrodynamic action	169
518. Expression of the determinants in terms of the components of the vector-potential of the current	170
519. The part of the force which is indeterminate can be expressed as the space-variation of a potential	170
520. Complete expression for the action between two finite currents	171
521. Mutual potential of two closed currents	171
522. Appropriateness of quaternions in this investigation	171
523. Determination of the form of the functions by Ampère's fourth case of equilibrium	172
524. The electrodynamic and electromagnetic units of currents ..	172
525. Final expressions for electromagnetic force between two elements	173
526. Four different admissible forms of the theory	173
527. Of these Ampère's is to be preferred	174

CHAPTER III.

ON THE INDUCTION OF ELECTRIC CURRENTS.

Art.	Page
528. Faraday's discovery. Nature of his methods	175
529. The method of this treatise founded on that of Faraday ..	176
530. Phenomena of magneto-electric induction	178
531. General law of induction of currents	179
532. Illustrations of the direction of induced currents	179
533. Induction by the motion of the earth	180
534. The electromotive force due to induction does not depend on the material of the conductor	181
535. It has no tendency to move the conductor	182
536. Felici's experiments on the laws of induction	182
537. Use of the galvanometer to determine the time-integral of the electromotive force	184
538. Conjugate positions of two coils	185
539. Mathematical expression for the total current of induction ..	186
540. Faraday's conception of an electrotonic state	187
541. His method of stating the laws of induction with reference to the lines of magnetic force	188
542. The law of Lenz, and Neumann's theory of induction	189
543. Helmholtz's deduction of induction from the mechanical action of currents by the principle of conservation of energy	190
544. Thomson's application of the same principle	191
545. Weber's contributions to electrical science	193

CHAPTER IV.

ON THE INDUCTION OF A CURRENT ON ITSELF.

546. Shock given by an electromagnet	195
547. Apparent momentum of electricity	195
548. Difference between this case and that of a tube containing a current of water	196
549. If there is momentum it is not that of the moving electricity ..	196
550. Nevertheless the phenomena are exactly analogous to those of momentum	196
551. An electric current has energy, which may be called electro- kinetic energy	197
552. This leads us to form a dynamical theory of electric currents ..	197

CHAPTER V.

ON THE EQUATIONS OF MOTION OF A CONNECTED SYSTEM.

Art.	Page
553. Lagrange's method furnishes appropriate ideas for the study of the higher dynamical sciences	199
554. These ideas must be translated from mathematical into dynamical language	199
555. Degrees of freedom of a connected system	200
556. Generalized meaning of velocity	201
557. Generalized meaning of force	201
558. Generalized meaning of momentum and impulse	201
559. Work done by a small impulse	203
560. Kinetic energy in terms of momenta, (T_p)	203
561. Hamilton's equations of motion	205
562. Kinetic energy in terms of the velocities and momenta, (T_{pq}) ..	206
563. Kinetic energy in terms of velocities, (T_q)	206
564. Relations between T_p and T_q , p and q	207
565. Moments and products of inertia and mobility	208
566. Necessary conditions which these coefficients must satisfy ..	209
567. Relation between mathematical, dynamical, and electrical ideas	209

CHAPTER VI.

DYNAMICAL THEORY OF ELECTROMAGNETISM.

568. The electric current possesses energy	211
569. The current is a kinetic phenomenon	211
570. Work done by electromotive force	212
571. The most general expression for the kinetic energy of a system including electric currents	213
572. The electrical variables do not appear in this expression ..	214
573. Mechanical force acting on a conductor	215
574. The part depending on products of ordinary velocities and strengths of currents does not exist	216
575. Another experimental test	218
576. Discussion of the electromotive force	220
577. If terms involving products of velocities and currents existed they would introduce electromotive forces, which are not observed	221

CHAPTER VII.

THEORY OF ELECTRIC CIRCUITS.

Art.	Page
578. The electrokinetic energy of a system of linear circuits	223
579. Electromotive force in each circuit	224
580. Electromagnetic force	225
581. Case of two circuits	226
582. Theory of induced currents	226
583. Mechanical action between the circuits	227
584. All the phenomena of the mutual action of two circuits depend on a single quantity, the potential of the two circuits ..	228

CHAPTER VIII.

EXPLORATION OF THE FIELD BY MEANS OF THE SECONDARY
CIRCUIT.

585. The electrokinetic momentum of the secondary circuit	229
586. Expressed as a line-integral	230
587. Any system of contiguous circuits is equivalent to the circuit formed by their exterior boundary	230
588. Electrokinetic momentum expressed as a surface-integral ..	230
589. A crooked portion of a circuit equivalent to a straight portion	231
590. Electrokinetic momentum <i>at a point</i> expressed as a vector, \mathcal{M} ..	232
591. Its relation to the magnetic induction, \mathcal{B} . Equations (A) ..	233
592. Justification of these names	234
593. Conventions with respect to the signs of translations and rota- tions	234
594. Theory of a sliding piece	235
595. Electromotive force due to the motion of a conductor	236
596. Electromagnetic force on the sliding piece	237
597. Four definitions of a line of magnetic induction	237
598. General equations of electromotive force, (B)	238
599. Analysis of the electromotive force	240
600. The general equations referred to moving axes	241
601. The motion of the axes changes nothing but the apparent value of the electric potential	243

Art.	Page
602. Electromagnetic force on a conductor	243
603. Electromagnetic force on an element of a conducting body. Equations (C)	244

CHAPTER IX.

GENERAL EQUATIONS OF THE ELECTROMAGNETIC FIELD.

604. Recapitulation	247
605. Equations of magnetization, (D)	248
606. Relation between magnetic force and electric currents	249
607. Equations of electric currents, (E)	250
608. Equations of electric displacement, (F)	252
609. Equations of electric conductivity, (G)	253
610. Equations of total currents, (H)	253
611. Currents in terms of electromotive force, (I)	253
612. Volume-density of free electricity, (J)	254
613. Surface-density of free electricity, (K)	254
614. Equations of magnetic permeability, (L)	254
615. Ampère's theory of magnets	254
616. Electric currents in terms of electrokinetic momentum	255
617. Vector-potential of electric currents	256
618. Quaternion expressions for electromagnetic quantities	257
619. Quaternion equations of the electromagnetic field	258
Appendix to Chapter IX	259

CHAPTER X.

DIMENSIONS OF ELECTRIC UNITS.

620. Two systems of units	263
621. The twelve primary quantities	263
622. Fifteen relations among these quantities	264
623. Dimensions in terms of $[e]$ and $[m]$	265
624. Reciprocal properties of the two systems	266
625. The electrostatic and the electromagnetic systems	266
626. Dimensions of the twelve quantities in the two systems	267
627. The six derived units	267
628. The ratio of the corresponding units in the two systems	267
629. Practical system of electric units. Table of practical units	268

CHAPTER XI.

ON ENERGY AND STRESS IN THE ELECTROMAGNETIC FIELD.

Art.	Page
630. The electrostatic energy expressed in terms of the free electricity and the potential	270
631. The electrostatic energy expressed in terms of the electromotive force and the electric displacement	270
632. Magnetic energy in terms of magnetization and magnetic force	271
633. Magnetic energy in terms of the square of the magnetic force	271
634. Electrokinetic energy in terms of electric momentum and electric current	272
635. Electrokinetic energy in terms of magnetic induction and magnetic force	273
636. Method of this treatise	273
637. Magnetic energy and electrokinetic energy compared	274
638. Magnetic energy reduced to electrokinetic energy	275
639. The force acting on a particle of a substance due to its magnetization	276
640. Electromagnetic force due to an electric current passing through it	276
641. Explanation of these forces by the hypothesis of stress in a medium	278
642. General character of the stress required to produce the phenomena	279
643. When there is no magnetization the stress is a tension in the direction of the lines of magnetic force, combined with a pressure in all directions at right angles to these lines, the magnitude of the tension and pressure being $\frac{1}{8\pi}\mathfrak{G}^2$, where \mathfrak{G} is the magnetic force	281
644. Force acting on a conductor carrying a current	282
645. Theory of stress in a medium as stated by Faraday	282
645. Numerical value of magnetic tension	283
Appendix I	284
Appendix II	285

CHAPTER XII.

CURRENT-SHEETS.

Art.	Page
647. Definition of a current-sheet	286
648. Current-function	286
649. Electric potential	287
650. Theory of steady currents	287
651. Case of uniform conductivity	287
652. Magnetic action of a current-sheet with closed currents	288
653. Magnetic potential due to a current-sheet	289
654. Induction of currents in a sheet of infinite conductivity	290
655. Such a sheet is impervious to magnetic action	290
656. Theory of a plane current-sheet	291
657. The magnetic functions expressed as derivatives of a single function	291
658. Action of a variable magnetic system on the sheet	293
659. When there is no external action the currents decay, and their magnetic action diminishes as if the sheet had moved off with constant velocity R	294
660. The currents, excited by the instantaneous introduction of a magnetic system, produce an effect equivalent to an image of that system	295
661. This image moves away from its original position with velo- city R	296
662. Trail of images formed by a magnetic system in continuous motion	296
663. Mathematical expression for the effect of the induced currents	297
664. Case of the uniform motion of a magnetic pole	297
665. Value of the force acting on the magnetic pole	298
666. Case of curvilinear motion	299
667. Case of motion near the edge of the sheet	299
668. Theory of Arago's rotating disk	300
669. Trail of images in the form of a helix	303
670. Spherical current-sheets	304
671. The vector-potential	305
672. To produce a field of constant magnetic force within a spherical shell	306
673. To produce a constant force on a suspended coil	306
674. Currents parallel to a plane	307

Art.		Page
675.	A plane electric circuit. A spherical shell. An ellipsoidal shell	308
676.	A solenoid	309
677.	A long solenoid	310
678.	Force near the ends	311
679.	A pair of induction coils	311
680.	Proper thickness of wire	312
681.	An endless solenoid	313

CHAPTER XIII.

PARALLEL CURRENTS.

682.	Cylindrical conductors	315
683.	The external magnetic action of a cylindric wire depends only on the whole current through it	316
684.	The vector-potential	317
685.	Kinetic energy of the current	317
686.	Repulsion between the direct and the return current	318
687.	Tension of the wires. Ampère's experiment	318
688.	Self-induction of a wire doubled on itself	320
689.	Currents of varying intensity in a cylindric wire	320
690.	Relation between the electromotive force and the total current	322
691.	Geometrical mean distance of two figures in a plane	324
692.	Particular cases	326
693.	Application of the method to a coil of insulated wires	328

CHAPTER XIV.

CIRCULAR CURRENTS.

694.	Potential due to a spherical bowl	331
695.	Solid angle subtended by a circle at any point	333
696.	Potential energy of two circular currents	334
697.	Moment of the couple acting between two coils	335
698.	Values of P'_1	336
699.	Attraction between two parallel circular currents	336
700.	Calculation of the coefficients for a coil of finite section	337
701.	Potential of two parallel circles expressed by elliptic integrals	338
