This book was carefully produced. Nevertheless, editor, authors and publisher do not warrant the information contained therein to be free of errors. Readers are advised to keep in mind that statements, data, illustrations, procedural details or other items may inadvertently be inaccurate.

Cover Illustration: Poly[5-[phenoxytris(ethoxy)carbonyl]bicyclo[2.2.1]hept-2-ene] was prepared via ring-opening metathesis polymerization of the corresponding monomer in the presence of bis(tricyclohexylphosphine)benzylideneruthenium(IV) dichloride. This thermally stable functionalized polynorbornene has a thermogravimetric decomposition temperature of 431°C. Reproduced by courtesy of Professor Alaa S. Abd-El-Aziz, University of Winnipeg, Canada.

# Preface

In the last 50 years, many comprehensive books on polymers have been published, but few have been dedicated to detailed treatment of those polymers that are industrially important. Only a small percentage of polymers discovered through laboratory research reach commercial status. Many potential candidates for commercialization are rejected for scale-up because of the many tests that each candidate must pass before a decision is made to manufacture and sell it. Therefore, publications offering in-depth coverage of commercially significant polymers and their manufacturing processes are valuable to those whose careers are focused on industrial polymer manufacture.

Since 1998, the sixth edition of *Ullmann's Encyclopedia of Industrial Chemistry*, a comprehensive multi-volume treatise devoted solely to both polymeric and non-polymeric chemicals encountered in the industrial world, has been the standard reference text. Inevitably, one drawback of the accumulation of all of this information in a single, massive work was that its acquisition required considerable expenditure. This problem is now being addressed by Wiley-VCH. The "Industrial Polymers Handbook: Products, Processes, Applications" is being created as a separate publication for the first time by extraction from the complete multi-volume encyclopedia of selected chapters on polymers. Basic principles and fundamental processes associated with industrial polymer manufacture are being discussed. Chapters on polymer nomenclature and on polyureas have been written especially for this book.

The first section of the book describes polymerization processes in detail, addresses trends in polymer reaction engineering, polymerization mechanisms and kinetics, and polymerization processes and reactor modeling. The next section includes a comprehensive presentation of source-based and structure-based polymer nomenclature and covers descriptions of the syntheses and characteristics of the industrially important polymer classes: step-growth polymers (polyamides, polycarbonates, polyesters, polyimides, polyureas, and polyurethanes); chain-growth polymers (acrylic, ethylenic, and vinyl); polyoxymethylenes; polymers formed by ring-opening reactions; resins (including alkyd, amino, epoxy, phenolic, and unsaturated polyester types); and miscellaneous types [electrically conducting polymers, inorganic polymers, poly(phenylene oxides), and silicones]. Also included are biopolymers and their derivatives: cellulose and its esters and ethers; chitin and chitosan; gelatin; nucleic acids, polysaccharides, proteins, natural resins, silk, starch, and wool.

Each chapter begins with an introduction to the subject under discussion, which is followed by a detailed description of the basic principles of the subject. For the synthetic polymer classes covered by the book, the practical aspects of manufacture are discussed in a wealth of detail. For the biopolymers and their derivatives, there is information on manufacture (where appropriate), and extensive treatment of their properties and industrial processing.

My thanks go to all contributing authors, especially to Professor Constantin I. Chiriac and researcher Mrs. Fulga M. Tanasa, both of the Institute of Molecular Chemistry "Petru Poni", Iasi (Jassy), Romania, for their prompt contribution to the chapter on polyureas, to the Wiley-VCH team for their support, and to my wife for her unending patience, encouragement, and understanding.

Wilmington, Delaware, September, 2000

Edward S. Wilks

# Contents

## Part I: Polymerization Processes ..... 1

### I Polymerization Processes ..... 3

- |   |   |
|---|---|
| 1.1. Introduction—Trends in Polymer Reaction Engineering ..... 10 | 1.3. Polymerization Processes and Reactor Modeling ..... 64 |
| 1.2. Polymerization Mechanisms and Kinetics ..... 11              | 1.4. References ..... 173                                   |

## Part II: Synthetic Polymers ..... 201

### I Nomenclature ..... 203

#### I Polymer Nomenclature ..... 205

## List of symbols

A	chemical species; vacant adsorption site
[A]	concentration of species A
[A] <sub>0</sub>	initial concentration of species A
A <sub>1</sub> , A <sub>2</sub> , A <sub>3</sub>	adjustable parameters
ABS	acrylonitrile–butadiene–styrene rubber-modified copolymer
ACA	aminocaproic acid
A(h)	energy required to separate to a distance $h=\infty$ , two drops of diameter $d=1$ initially separated by a distance $h_0$
A <sub>m</sub>	surface area of micelles
A <sub>p</sub>	surface area of polymer particles

B	chemical species
BHET	bis-hydroxyethyl terephthalate
BR	batch reactor
$C_{pi}$	dimensionless moments of polymer distribution for chain transfer to polymer [ $= K_{tp} Q_i / (K_p [M])$ ]
$C_s$	surfactant concentration
CCD	chemical composition distribution
CMC	critical micelle concentration
CPFR	continuous plug flow reactor
CSTR	continuous stirred-tank reactor with an ideal residence-time distribution
CTA	chain-transfer agent
$d$	particle diameter
$\bar{d}$	average particle diameter
$d_{32}$	Sauter mean diameter of a spherical-particle suspension
$d_{50}$	diameter at which 50 wt % of particles pass through a sieve
$d_{\min}$	minimum particle diameter
$d_{\max}$	maximum particle diameter
$D$	stirrer diameter
$D_{op}$	mean diffusion coefficient for oligomeric radicals and latex particles
DMT	dimethyl terephthalate
$E_d$	activation energy for initiator decomposition
$E/E_0$	mass fraction of material passing out of reactor with a residence time $t$ to $t + dt$
$E_t$	activation energy for chain-transfer reaction
$E_L$	activation energy for average chain lengths
$E_N$	activation energy for polymer particle nucleation
$E_p$	activation energy for propagation
$E_R$	activation energy for polymerization
$E(t)$	residence-time distribution for a flow reactor at steady state
$E_t$	activation energy for bimolecular termination
$Eu$	modified power number
EG	ethylene glycol
EGDMA	ethylene glycol dimethacrylate
EPS	expandable polystyrene
ESR	electron spin resonance spectroscopy
$f$	initiator efficiency; functionality of monomer
$f_j$	mole fraction of monomer of type $j$
$F_{i, \text{in}}$	molar flow rate of monomer of type $i$ into the reactor
$F_{\text{in}}$	total molar flow rate (of all monomer types) into the reactor
$F_{I, \text{in}}$	molar flow rate of initiator of type $i$ into the reactor
$F_j$	mole fraction of monomer of type $j$ , chemically bound in polymer produced instantaneously
$\bar{F}_j$	mole fraction of monomer of type $j$ chemically bound in accumulated polymer
$\bar{F}_1$	mole fraction of monomer 1 (containing an abstractable atom) in accumulated polymer
$\bar{F}_2$	mole fraction of monomer 2 (containing a reactive carbon-carbon bond)
$F_{pi, \text{in}}$	molar flow rate of monomer of type $i$ chemically bound in polymer into the reactor
$Fr$	Froude number

$F_{T, in}$	molar flow rate of chain-transfer agent T into the reactor
$G^+$	counterion
GPC	gel permeation chromatography
HCSTR	homogeneous CSTR
HDPE	high-density polyethylene
H-H	Hui-Hamielec styrene polymerization model
HIPS	high-impact polystyrene
I	initiator or catalyst
[I]	concentration of initiator or catalyst
$K$	chemical rate constant; equilibrium constant
$K_a$	absorption constant for oligomeric radicals entering polymer particles
$K_A$	adsorption rate constant
$K_d$	initiator decomposition constant
$K_{dp}$	depropagation constant
$K_D$	desorption rate constant
$K_{ij}$	rate constant for polymeric radical of type $i$ abstracting an atom from monomer of type $j$ chemically bound in polymer
$K_{fm}$	transfer to monomer rate constant
$K_{fp}$	rate constant for chain transfer to polymer
$K_{fT}$	rate constant for chain transfer to CTA
$K_{fT'}$	rate constant for chain transfer from polymeric radical of type $i$ to CTA
$K_{EX}$	transfer to small molecule X rate constant
$K_i$	rate constant for monomer adding to a primary radical
$K_p$	propagation rate constant
$K'_p$	propagation rate constant for transfer radical
$K_p^-$	propagation rate constant for free ion
$K_p^\pm$	propagation rate constant for ion pair
$K_p^*$	rate constant for polymeric radicals adding to pendant double bonds on polymer chains
$K_{pi}, K_{ij}$	propagation rate constant for monomer of type $j$ adding to polymeric active center of type $i$
$K_{pe}$	rate constant for polymeric radical of type $i$ adding to a double bond on a monomer unit of type $j$ chemically bound in the polymer
$K_{p,ik}$	propagation rate constant for monomer of type $k$ adding to a polymeric active center of type $ij$
$K_t$	total bimolecular termination constant ( $K_{tc} + K_{td}$ )
$K_{t0}$	total bimolecular termination constant at zero conversion of monomer
$K_{tc}$	rate constant for bimolecular termination by combination
$K_{tc,ij}$	termination by combination rate constant for polymeric radicals of types $i$ and $j$ (chemical control)
$\bar{K}_{tcN}$	number-average bimolecular termination constant by combination
$K_{td}$	rate constant for bimolecular termination by disproportionation
$K_{td,ij}$	termination by disproportionation rate constant for polymeric radicals of types $i$ and $j$ (chemical control)
$\bar{K}_{tdN}$	number-average bimolecular termination constant by disproportionation
$\bar{K}_{tN}$	total number-average bimolecular termination constant
$K_{tp}$	termination rate constant in polymer particles

$K_t(r, s)$	total bivariate distribution for diffusion-controlled bimolecular termination of polymeric species of chain lengths $r$ and $s$
$K_{tw}$	termination rate constant in aqueous phase
$K_{tw}, \bar{K}_{LZ}$	total weight- and z-average bimolecular termination constants
$L$	characteristic length of energy-containing large eddies
$L$	length of path traversed by a growing radical from its point of origin to the point where it precipitates
$L$	reactor length
LALLS	low-angle laser light scattering
LCB	long-chain branching
LDPE	low-density polyethylene
LLDPE	linear low-density polyethylene
$m_i$	number of moles of monomer $i$ in terpolymer (Eq. 3.101)
$M_c$	average molecular mass between cross-links
$M_i$	monomer of type $i$
$M_m$	aggregation number for emulsifier molecules in micelles
$M_{mi}$	molecular mass of monomer of type $i$
$\bar{M}_N, \bar{M}_W, \bar{M}_Z, \bar{M}_{Z+1}$	number-, weight-, $Z$ and $Z+1$ -average molar mass (molecular mass, respectively)
$[M]$	total monomer concentration
$[M]_0$	initial monomer concentration; monomer concentration in feed
$[M]_c$	equilibrium concentration of monomer at the ceiling temperature
$[M_i]$	concentration of monomer of type $i$
$[M]_p$	concentration of monomer in the polymer particles
M-H	Marten-Hamielec polymerization model
MMA	methyl methacrylate
MWD	molecular mass distribution (molar mass distribution)
$n$	number of monomer types
$n$	order of reaction
$\bar{n}$	average number of radicals per particle
$N_0, N$	number of functional groups at time zero and $t$
$N$	total number of moles in the reactor; stirrer speed
$N_A$	number of moles of A-functional groups; Avogadro number
$N_{A_0}$	initial number of moles of A-functional groups
$N_B$	number of moles of B-functional groups
$N_{B_0}$	initial number of moles of B-functional groups
$N_i$	moles of monomer of type $i$ in the reactor
$N_i$	number of moles of initiator in the reactor; number of growing chains
$N_{I_0}$	initial number of moles of initiator in the reactor
$N_{Ii}$	moles of initiator of type $i$ in the reactor
$N(r)$	number chain length distribution (number-fraction of polymer molecules of chain length $r$ )
$N_M$	number of monomer units; number of micelles; number of monomer molecules consumed
$N_n$	number of polymer particles containing $n$ radicals
$N_p$	number of polymer particles per unit volume
$N_T$	moles of CTA in reactor

NBR	nitrile-butadiene rubber
NIRS	near infrared spectroscopy
$p$	conversion of functional groups
$p_c$	critical threshold
$P$	growing polymer particle; polymer
$P_c$	conversion of functional groups at gelation point
$P_{cr}$	critical chain length for precipitation
$P_i$	moles of monomer of type $i$ chemically bound in polymer in the reactor
$P_{ij}$	polymer containing $i$ units of monomer of type 1 and $j$ units of monomer of type 2
$[P_m]$	concentration of polymer with chain length $m$
$P_{m,n}$	dead polymer chain containing $m$ units of monomer 1 and $n$ units of monomer 2
$P_N$	number-average chain length of polymer produced instantaneously
$\bar{P}_N$	number-average chain length of accumulated polymer
$\bar{P}_N^{sol}$	number-average chain length of sol molecules
$P_r$	polymer molecule of chain length $r$
$P_W$	weight-average chain length of polymer produced instantaneously
$\bar{P}_W$	weight-average chain length of accumulated polymer
$\bar{P}_W^{sol}$	weight-average chain length of sol molecules
PDI	polydispersity index of polymer produced instantaneously
$\overline{PDI}$	polydispersity index of accumulated polymer
PE	polyethylene
PEK	polyetherketone
PES	polyethersulfone
PETP	poly(ethylene terephthalate)
PFR	plug-flow reactor
PMMA	poly(methyl methacrylate)
PP	polypropylene
PPS	poly(phenylene sulfide)
PS	polystyrene
PSD	particle size distribution
PVAL	poly(vinyl alcohol), partially hydrolyzed
PVC	poly(vinyl chloride)
$P^*$	polymeric active center
$[P^*]$	concentration of polymeric active centers (ionic or radical type)
$P^*_i$	polymeric active center with active center located on monomer of type $i$ chemically bound in the polymer chain
$P^*_{ij}$	polymeric active center with active center located on monomer of type $j$ which is adjacent to monomer of type $i$ chemically bound in the polymer chain
$P^*_{m,n,i}$	polymer chain containing $m$ units of monomer 1, $n$ units of monomer 2, with active center on monomer $i$
$Q_i$	$i$ -th moment of the dead polymer distribution
$r$	polymer chain length
$r$	polymer particle radius
$r_M$	micelle radius
$r_p$	polymer particle radius
$r_1, r_2$	reactivity ratios
$R$	gas constant
