Preface

In this Preface to the Sixth Edition, we acknowledge and note that it has been built on the work of previous editors. We especially need to note that Frank Patty's words in the Preface of the second edition are cogent:

This book was planned as a ready, practical reference for persons interested in or responsible for safeguarding the health of others working with the chemical elements and compounds used in industry today. Although guidelines for selecting those chemical compounds of sufficient industrial importance for inclusion are not clearly drawn, those chemicals found in carload price lists seem to warrant first consideration.

When available information is bountiful, an attempt has been made to limit the material presented to that of a practical nature, useful in recognizing, evaluating, controlling possible harmful exposures. Where the information is scanty, every fragment of significance, whether negative or positive, is offered the reader. The manufacturing chemist, who assumes responsibility for the safe use of his product in industry and who employs a competent staff to this end, as well as the large industry having competent industrial hygiene and medical staffs, are in strategic positions to recognize early and possibly harmful exposures in time to avoid any harmful effects by appropriate and timely action. Plant studies of individuals and their exposures regardless of whether or not the conditions caused recognized ill effects offer valuable experience. Information gleaned in this manner, though it may be fragmentary, is highly important when interpreted in terms of the practical health problem.

While we have not insisted that chemical selection be based on carload quantities, we have been most concerned about agents (chemical and physical) in the workplace that are toxicological concerns for workers. We have attempted to

follow the guide as expressed by Frank Patty in 1962 regarding practical information.

This edition includes toxicological information on flavorings, metal working fluids, pharmaceuticals, and nanoparticles which were not previously covered, and reflects our concern with their technology and potential for adverse health effects in workers. It also continues to include the toxicology of physical and biological agents which were in the Fifth Edition. In the workplace of this new century, physical agents and human factors continue to be of concern as well as, nanotechnology. Traditionally, the agents or factors such as ergonomics, biorhythms, vibration, heat and cold stress were centered on how one measures them. Today, understanding the toxicology of these agents (factors) is of great importance because it can assist in the anticipation, recognition, evaluation and control of them. The mechanisms of actions and the assessment of the adverse health effects are as much a part of toxicology as dusts and heavy metals. As noted in Chapter 74 in Volume 5, the trend in toxicology is increasingly focused on molecular biology, mechanisms of action, and, molecular genetics.

The thinking and planning of this edition was a team effort by Barbara and Eula based on the framework that was established for the Fifth Edition by us and Charles H. Powell who died in September 1998. The three of us have had a long professional association with the Kettering Laboratory: Charles H. Powell received his ScD., Barbara Cohrssen received a MS, and Eula Bingham, has been a lifetime faculty member. Many of the authors were introduced to us through this relationship and association.

We are grateful for the help of our expert contributors, many of whom we have known for 10, 20 or 30 years, to complete this edition. The team effort was fostered between

the current editors by many of the first contributors to Patty's such as Robert A. Kehoe, Francis F. Heyroth, William B. Deichmann, and Joseph Treon, all of whom were at the University of Cincinnati, Kettering Laboratory, sometime during their professional lives.

The authors have performed a difficult task in a short period of time for a publication that is as comprehensive as this one is. We want to thank Meghan Lobaugh whose assistance is greatly appreciated. We would like to express

our deep appreciation and thanks to everyone who has helped us with this publication.

PATTY'S TOXICOLOGY

Sixth Edition

Volume 1

Toxicological Issues Related to Metals and Metal Compounds

Neurotoxicology and Radiation

Compounds of Inorganic Nitrogen, Carbon, Oxygen and Halogens

Contents

1 Ionizing Radiation	1
Henry Spitz, Ph.D. and Roy E. Albert, MD	
2 Metallocenes	23
Gary P. Bond, Ph.D., DABT	
3 Neurotoxicology and Behavior	35
William K. Boyes, Ph.D.	
4 Silver and Gold	75
Alan B. G. Lansdown, Ph.D., F.R.S.C, F.S.B., F.R.C.Path	
5 Beryllium	113
Laura S. Welch, MD	
6 Magnesium, Calcium, Strontium, Barium, and Radium	145
Mary Beth Genter, Ph.D., DABT	
7 Zinc and Cadmium Compounds	167
Marek Jakubowski, Ph.D.	
8 Mercury	213
Philippe Grandjean, MD, Ph.D. and Takashi Yorifuji, MD, Ph.D.	
9 Aluminum	229
Oyeboode A. Taiwo, MD, MPH and Bernadette Storey-Laubach, MS	

10	Gallium, Indium, and Thallium	257
	Guillermo Repetto, MD and Ana del Peso, Ms. Tox.	
11	Germanium, Tin, and Copper	355
	James H. Stewart, Ph.D., CIH, CSP, David Macintosh, ScD, CIH, Joseph Allen, ScD, and John McCarthy, ScD, CIH	
12	Lead	381
	David E. Jacobs, Ph.D., CIH	
13	Titanium, Zirconium, and Hafnium	427
	Barbara Malczewska-Toth, Ph.D., DABT	
14	Arsenic, Antimony, and Bismuth	475
	Bruce A. Fowler, Ph.D., Emily F. Madden, Ph.D., and Selene Chou, Ph.D.	
15	Vanadium, Niobium, and Tantalum	511
	Konrad Rydzynski, M.D., Ph.D. and Daria Pakulska, PhD.	
16	Chromium, Molybdenum, and Tungsten	565
	Sverre Langård, MD, MSc Toxicol, Ph.D., Dominique Lison, MD, Ph.D., and Per Sørstrand, MSc Chemistry	
17	Manganese and Rhenium	607
	Tiina Santonen, MD, Ph.D. and Antero Aitio, MD, Ph.D.	
18	Iron and Cobalt	637
	L. Faye Grimsley, Ph.D., CIH and Erica L. Harris, MSPH	
19	Nickel, Ruthenium, Rhodium, Palladium, Osmium, and Platinum	653
	Slawomir Czerczak, Ph.D., Jan P. Gromiec, Ph.D., Anna Pałaszewska-Tkacz, MSc., and Anna Świdwińska-Gajewska, MSc.

Ionizing Radiation

Henry Spitz, Ph.D. and Roy E. Albert, MD

1 INTRODUCTION

Ionizing radiation is undoubtedly one of the most intensely studied of all toxic agents. The impetus for understanding its manifold effects came from its extensive use since the beginning of the century in medical diagnosis and treating cancer. With the development of nuclear weapons and atomic energy during World War II, the field expanded dramatically. The potential health hazards from occupational and environmental sources of radiation became an important area for research; it spawned a new field in the post-World War II era of measurement and control called health physics.

Under the Atomic Energy Commission (AEC), a great national laboratory complex was established for research on weapons and power production and for biomedical and physics research. Long-term biomedical research was also initiated at large university-based facilities and by the support of individual grants obtained by the faculty. The development and sale of radioisotopes and radiation measuring instruments were initially subsidized by the AEC to the great benefit of biomedical research in general. Radiation biology has its own society (the Radiation Research Society), and its own journal, the *Journal of Radiation Research*. In recent years, radiation has become an integral tool for understanding the cellular function at the molecular level. However, the level of biomedical research on radiation is much lower in the last few decades than earlier.

This chapter gives toxicologists the basic features of radiation biology. Because of the scope of the field, only the essential concepts are presented. The reader is referred to textbooks (1–6), websites, and other publications cited for more details.

2 PHYSICAL CONSIDERATIONS

There are two forms of ionizing radiation: high-energy electromagnetic waves and subatomic particles. Their common property is the ability, by direct or indirect means, to eject electrons from molecules, a phenomenon called ionization. At levels of lesser energy deposition, they are also capable of raising electrons to higher energy levels, a mechanism called excitation. Both ionization and excitation can lead to chemical change. Thermal effects are of no consequence in the biological effects of ionizing radiation. For example, a lethal whole-body exposure of 20 Gy (2000 rads) would raise the body temperature by only 0.01°C.

The energy of ionizing radiation is expressed in electron volts (eV). The energy range of ionizing radiation is large, from a few electron volts to billions of electron volts. Most commonly encountered is the kilovolt (keV) and megavolt (MeV) domain. The average energy that causes ionization in tissue is about 75 eV.

2.1 Electromagnetic Radiation

Electromagnetic radiation is propagated in packets called photons. The energy of photons is a function of the wave frequency, namely $E = h\nu$. These frequencies range over many decades. Electromagnetic radiation, in order of increasing frequency and energy, includes radio waves, infrared radiation, visible radiation, ultraviolet radiation, and ionizing radiation. Among the nonionizing radiation, ultraviolet light can cause excitation but not ionization, and infrared radiation causes heating.

Gamma rays and X-rays are two names for electromagnetic ionizing radiation (photons). They have identical
