# Preface

*The proceedings of the 2nd symposium of The Johns Hopkins Center for Alternatives to Animal Testing, held in May of 1983, are published in this volume. The meeting was historic in that all segments of our society dealing with acute toxicity and the issue of the use of animals in testing were represented. We were fortunate to have a group of outstanding and well-recognized experts to speak to the important issues of Acute Toxicity Testing—Are There Alternative Approaches? The outcome of the meeting resulted in and provided the scientific basis for a multi-branch governmental meeting to examine their policies regarding the LD<sub>50</sub>.*

*The program for the second symposium of The Johns Hopkins Center for Alternatives to Animal Testing was developed about a year prior to the actual meeting. The Advisory Board of the Center examined the broad issues of topics that might be appropriate for such a symposium. They suggested that the topic be timely, highly focused, and offer the opportunity for a thorough evaluation of a defined and important question. A subcommittee of the Advisory Board, consisting of Gareth Green, Leon Golberg, and Thomas Hickey, met with me on several occasions to work out the concept and the program. The final program was re-evaluated by the entire Advisory Board at a meeting that took place in November 1982 and the symposium took place five months later. The end result of the symposium—although predictable from the scientific standpoint, but unexpected—was a consensus of all present that the LD<sub>50</sub>, in the classical sense, could be replaced by approaches using considerably less animals. The participation encompassed academic, industrial, regulatory and advocate groups. There was a full airing of the issues; and the fact that a consensus was reached attests to the quality of the presentations, workshops, posters and discussions.*

*The first day, and part I of this volume, focuses on prepared presentations which address the why, the how, and the what of acute toxicity testing. Part II presents several posters which address additional specific issues. These presentations and posters provided the background information for the workshops. Part III, the workshops, deals with the difficult scientific issues associated with the development of in vitro methodology. A review of each workshop is provided. This is an almost verbatim transcript of what was reported to the entire conference. Part IV examines these discussions from a regulatory standpoint.*

*As part of the audience, I was treated to well-developed rationales examining the purposes and practices of acute toxicity testing. Clearly, as the conference and workshops became completed, our biases, outlooks and approaches were modified. We defined what can and what cannot be accomplished in the development of in vitro toxicological methods for acute toxicity testing in general and for the LD<sub>50</sub> specifically.*

*I would like to most sincerely thank the Cosmetic, Toiletry and Fragrance Association and its member companies for establishing the Center. I am very grateful to the Bristol-Myers Company for sponsoring this symposium. Not only have they given financially but their encouragement, shared thinking, and enthusiasm is truly appreciated. I am most thankful.*

**Volume 2: Acute Toxicity Testing: Alternative Approaches**

## IMPORTANCE FOR TOXICOLOGY - RELEVANCE IN PRACTICE

Toxicologists often have a tendency to regard the world solely from their point of view. This may explain their preoccupation with acute toxicity testing which captures an inordinately large part of their attention.

TABLE I

## MAJOR CONCERNS IN CLINICAL USES OF NEW DRUGS

PHASE	POTENTIAL TOXIC EFFECTS
I and early	Acute Cardiovascular Reactions: Orthostatic Hypotension, Collapse, Arrhythmia, Myocardial Infarction
II	Gastrointestinal Disturbances: Hemorrhage, G.I. Paralysis, Vomiting CNS Disturbances: Seizures, Psychotic Reactions, Hallucinations, Somnolence, Depression Bronchopulmonary Reactions: Asthma, Bronchospasm Anaphylactic Reactions: Shock, Hemorrhages, Edema Miscellaneous Reactions: Hemolysis, Thrombosis, Local Irritation, Disulfiram-Like Effect
II and III	Cumulative Organ Toxicity: Liver, Kidney, Nervous System, Sensory Organs, Bone Marrow, Reproductive Organs Hypersensitivity Reactions, Endocrine Disturbances, Teratogenesis
Post-marketing	Idiosyncratic Reactions in Selected Populations Carcinogenesis, Mutagenesis, Drug Interactions, Rebound Effects, Tolerance, Drug Dependence, Abuse, Suicide, Accidental Poisoning

In fact, the acute toxicity test is the first biological experiment done with the majority of compounds synthesized by the chemists or discovered in the environment. It often provides a wealth of information which can greatly influence the fate of a new chemical. The results of acute toxicity tests are used as guidance for dose selection and design of further toxicologic experiments, they signal the presence of special hazards requiring immediate preventive measures, and they are sure to figure prominently in a data sheet or dossier, should the compound ever be registered with a regulatory agency.

For the people who have to deal with the chemicals outside toxicology acute toxicity testing has a different meaning. Let us consider the clinical pharmacologist who supervises the investigation of a potential new drug in volunteers and patients. His concerns with toxicity are summarized in Table I. In the early phases of the clinical trial the major hazards are functional disturbances, particularly of the cardiovascular, gastrointestinal and nervous systems and anaphylactic reactions. In order to prepare for these problems, the clinician consults the pharmacology section of the data sheet and not the information on acute toxicity. Acute toxicity tests are also of little use for the prediction of cumulative organ toxicity which is the major concern during extended clinical studies (Phase III). Only when the new drug reaches a wider distribution and gets in the hands of patients not closely supervised by the physician, does the problem of intentional or accidental overdosage reach significant proportions. It is at this time that the results of acute toxicity tests become of practical importance.
