Preface

The 30th Edition of the *American Drug Index* (ADI) has been prepared for the identification, explanation, and correlation of the many pharmaceuticals available to the medical, pharmaceutical, and allied health professions. The need for this index has become acute as the variety and number of drugs and drug products have continued to multiply. For this reason the *ADI* should be most useful to pharmacists, nurses, physicians, medical transcriptionists, dentists, sales personnel, students, and teachers in the fields incorporating pharmaceuticals. *Special note to medical transcriptionists:* Although all names in the *ADI* appear in bold capitalized type, trade products are easily identifiable by the manufacturer's name in parentheses immediately following the trade name. The names for official products are preceded by a bullet (•) and should appear in lower case in transcription. The therapeutic and pharmaceutical classes are denoted by a box (■) preceding the name and should be a helpful cross-reference guide.

The organization of the *ADI* falls into the following ten major sections: Monographs of Drug Products, Common Abbreviations Used in Medical Orders, Approximate Practical Equivalents, Common Systems of Weight and Measure, Glossary, Title Changes For U.S.P. XXI and N.F. XVI Monographs, Container Requirements for U.S.P. XXI Drugs, Container and Storage Requirements for Sterile U.S.P. XXI Drugs, Pharmaceutical Company Labeler Code Index Numbers, and Pharmaceutical Manufacturer and/or Drug Distributor Addresses. The U.S.P. XXI and N.F. XVI Title Changes section has been added to make the *ADI* an even more complete and valuable reference tool.

MONOGRAPHS: The organization of the monograph section of the *ADI* is fundamentally alphabetical with extensive cross-indexing. Names listed are generic (also called non-proprietary, public name, or common name); brand (also called trade-mark, proprietary, or specialty); and chemical. Synonyms that are in general use also are included. All names used for a pharmaceutical appear in alphabetical order with the pertinent data given under the brand name by which it is made available.

The monograph for a typical brand name product consists of the manufacturer, generic and/or chemical names, composition and strength, pharmaceutical forms available, package size, dosage, and use.

Generic names appear in alphabetical order, followed by the corresponding recognition of the drug to the U.S.P. (United States Pharmacopeia), N.F. (National Formulary), and USAN (United States Adopted Names). Each of these officially recognized generic names is preceded by a bullet (•) at the beginning of each entry. The information is in accord with the U.S.P. XXI and N.F. XVI and through Supplement 2, which became official on July 1, 1985; and the USAN-1986.

British Approved Names, indicated by (B.A.N.), are included in this edition with the permission of the Controller of Her Britannic Majesty's Stationery Office.

Because of the multiplicity of specialty names (brand names) used for the same therapeutic agent or the same combination of therapeutic agents, it was apparent that some correlation could be done. As an example of this, please turn to tetracycline HCl. Here under the generic name are listed the various brand names. Following are combinations of tetracycline HCl organized in a manner to point out relationships among the many products. Reference then is made to the specialty name or names having the indicated composition. Under the specialty name are given manufacturer, composition, available forms, sizes, dosage, and use.

The multiplicity of generic names for the same therapeutic agent has complicated the nomenclature of these agents. Examples of multiple generic names for the same chemical substance are (1) para-bromdylamine, brompheniramine; (2) acetaminophen, p-hydroxy acetanilid, N-acetyl-p-aminophenol; (3) guaifenesin, glycercyl guaiacolate, glycercyl guaiacol ether, guaianesin, guaifylline, guaiphenesin, guayanesin, methphenoxydiol; (4) pyrilamine, pyranisamine, pyranilamine, pyraminyl, anisopyradamine.

The cross-indexing feature of the *ADI* permits the finding of drugs or drug combinations when only one major ingredient is known. For example, a combination of aluminum hydroxide gel and magnesium trisilicate is available. This combination can be found by looking under the name of either of the two ingredients, and in each case the specialty names are given. A second form of cross-indexing involves the listing of drugs under various therapeutic and pharmaceutical classes (i.e., antacids, antihistamines, diuretics, laxatives, etc.). Each of these classes is preceded by a box (■) at the beginning of each entry.

ABBREVIATIONS: A listing of Common Abbreviations Used in Medical Orders is included as an aid in interpreting medical orders. The Latin or Greek word and abbreviation are both given with the meaning.

CONVERSION FACTORS: The listing of Approximate Practical Equivalents is added as an aid in calculating and converting dosages among the metric, apothecary, and avoirdupois systems.

WEIGHT AND MEASURE: Tables containing the Common Systems of Weight and Measure are included to aid the practitioner in calculating dosages in the metric, apothecary, and avoirdupois systems.

GLOSSARY: A listing of commonly used terms, with brief definitions, is included as an aid in interpreting the use given for drug monographs listed in the *ADI*.

NEW TITLES FOR U.S.P. XXI AND N.F. XVI MONOGRAPHS: 119 new official monographs appeared through Supplement 2 to the 1985 U.S.P. XXI and N.F. XVI, and an additional 535 new monographs have

appeared since the 1980 U.S.P. XX and N.F. XV. Since many of these new monographs apply to commonly used drug products, this section has been added to aid the practitioner in identifying drug products.

CONTAINER AND STORAGE REQUIREMENTS FOR U.S.P. XXI COMPENDIAL DRUGS: These sections have been added on container and storage requirements specified by the U.S.P. XXI for compendial drugs, to aid the practitioner in storing and dispensing.

ORAL DOSAGE FORMS THAT SHOULD NOT BE CRUSHED: For the first time this year, a section has been added to alert the health care practitioner about oral dosage forms that should not be crushed, and to serve as an aid in consulting with patients. Examples of products falling into the "non-crush" category are extended-release, enteric-coated, encapsulated beads, wax matrix, sublingual, and encapsulated liquid formulations.

LABELER CODE INDEX: The Pharmaceutical Labeler Code Index is presented to aid the practitioner in the identification of drug products. In this section, the codes are listed in numerical order followed by the name of the manufacturer.

MANUFACTURER ADDRESSES: The name, address, and zip code of virtually every American Pharmaceutical Manufacturer and/or Drug Distributor are listed in alphabetical order in this section. Additionally, a pharmaceutical labeler code number appears before the address of each company as a further aid in the identification of drug products.

A special word of appreciation and acknowledgment is given to my wife, Shirley, who served again this year as my Associate Editor—and helped to compile much of the information that appears in the monograph section of this volume. Special thanks are also extended to the manufacturers who supplied product information and made helpful comments and suggestions for this index, and to Dr. Kenneth S. Alexander, who organized the information on Container and Storage Requirements for U.S.P. XXI Drugs.

Correspondence or communication with reference to a drug or drug products listed in the *American Drug Index* should be directed to Norman F. Billups, Ph.D., Dean, College of Pharmacy; The University of Toledo; Toledo, Ohio 43606, or call 419-537-4235.
