#### **Preface**

Though perhaps not as intimidating as writing a book from scratch, taking on a new edition of an established text is a daunting task. William and Daphne Elliott, in their preface to the fourth edition, described this as a book 'designed for undergraduates taking science and health-related courses in biochemistry and molecular biology' and said that their aim was 'to provide a text suitable for students meeting those subjects for the first time, but of sufficient depth to be intellectually satisfying ... written in an approachable style, but with lots of explanation to promote understanding.' Our experience of using this book for undergraduate courses is that they succeeded in their aim, achieving what one reviewer has described as a style that is 'refreshingly different more personal and more direct' that 'seems to take the reader on a one-toone tutorial'. It is this admirable quality of the earlier editions that we have sought to retain. The book is aimed at students in the early years of their undergraduate programmes. It assumes little prior knowledge, and seeks to provide accessible explanations of terms and concepts that may be unfamiliar, while building up to a level that should enable students to tackle short review articles of the kind found in many journals. It also avoids giving the impression that biochemistry and molecular biology are closed subjects. Undergraduates at the beginning of their course are sometimes uncomfortable with the notion of uncertainty and ask to be given 'just the facts'. However, by emphasizing the relevance of this material to current medical and biological research and pointing out areas where our knowledge is still imperfect, we hope to give students an appreciation of the interest and importance of continuing developments and to inspire some of them to pursue their studies to a higher level.

It has been noted many times that adding new material to a textbook creates the dilemma of which older material should be discarded in order to keep the size of the book manageable. While we have tried to be up to date we have been relatively cautious about leaving anything out that was covered in previous editions, recent developments in metabolomics and cancer research having shown that those who suggested that certain metabolic topics or even the whole of metabolism were no longer worth learning were speaking prematurely. In genomics and molecular biology the vast quantity of new data and novel methodology presents particular challenges, and we have included some new material in that area. However, we have considered it worthwhile to retain coverage of techniques such as Southern blotting and library screening for now, even though they may be rarely used in modern laboratories, because we feel that knowledge of these methods provides an historic framework that allows students to build up a thorough understanding of our present position. In order to save space and allow for these additions and retentions we have taken the step of moving online the suggestions for further reading and the web based bioinformatics exercise. This has the added advantage that these resources can be more easily updated.

#### About the book

The book is organized into six main parts:

- 1 Basic concepts of life
- 2 Structure and function of proteins and membranes
- 3 Metabolism and nutrition
- 4 Information storage and utilization
- 5 Cells and tissues
- 6 Protective mechanisms against disease.

The chapters are arranged to give a seamless progression through the subject but we recognize that the order in which topics are taught varies with the teacher. There is, therefore, extensive cross-referencing between chapters in order to help students with their learning.

#### What is new in this edition?

- All the chapters have been reviewed to update them. The extent of the update varies in the different chapters from extensive rewriting and major additions to minor changes. A number of complex areas, which some students find difficult, have been rewritten for increased clarity. These include X-ray crystallography and nuclear magnetic resonance (Chapter 5); mechanisms of transport, storage and mobilization of dietary components (Chapter 11); mechanisms of metabolic control and their applications to metabolic integration (Chapter 20); homologous recombination (Chapter 23); cell signalling, particularly the insulin receptor and insulin signalling (Chapter 29); and vesicle transport of proteins (Chapter 27).
- A new chapter has been added, General principles of nutrition (Chapter 9) to introduce the subject and the terminology before dealing with the handling of dietary components.

- Material on regulation of gene expression, both transcriptional and post-transcriptional, has been reorganized and moved into a single new chapter (Chapter 26). This chapter includes an updated section on the role of chromatin in eukaryotic gene control with a new box on Genomic imprinting disorders (Box 26.1). It also incorporates material on microRNAs and RNA interference, which was given a separate chapter in the previous edition.
- The last section of the book has been reorganized. Part 5,
   Cells and tissues, is designed to illustrate how cell communication and coordination of cell division and cell
   death take place in eukaryotes, and then to illustrate
   how perturbation of these processes may lead to cancer.
   Part 6 then deals briefly with some special topics relating
   to protective mechanisms against disease.
- Cell division (mitosis and meiosis) is dealt with in the same chapter as the cell cycle (Chapter 30), which also includes cell death (apoptosis).

In metabolism, attention has been paid to the clinical relevance of the biochemical events. New material includes:

- Lipid transport, including cholesterol homeostasis and the hyperlipoproteinaemias.
- An extensive review of the regulation of metabolism in the fed state, fasting state, starvation and diabetes mellitus.
- New boxes: The Warburg effect (Box 13.1); Glucose-6-phosphate dehydrogenase deficiency (Box 15.1); Alcohol and the oriental flushing syndrome (Box 16.1); The alpha and the omega of fatty acids and diet (Box 17.1).

Important developments covered in Chapter 28 on DNA manipulation include the following:

 An introduction to Next Generation Sequencing methods for DNA and the potential medical application of rapid sequencing. No doubt these topics will gain still greater prominence in future editions.

- The principle of Genome Wide Association Studies used for elucidation of genetic causes for common complex diseases such as type 2 diabetes and coronary heart disease.
- Recent promising clinical trials using human embryonic stem cells, and the production of induced pluripotent stem cells from patients and their use to model diseases.

#### Using the book

This book includes a number of features to help make it easy to use, and to make learning from it as effective as possible.

- Index of diseases. A separate index of diseases and medically relevant topics helps students on health-related courses to identify relevant topics.
- Medical boxes. These illustrate the direct relevance of biochemistry and molecular biology to medicine and health-related issues. A separate list of these boxes is shown on the Contents pages.
- Questions and answers. Questions at the end of each chapter (with answers at the back of the book) are designed to support student learning.
- Chapter summaries. Summaries at the end of each chapter highlight the key concepts presented and aid revision.
- Further reading references. References online direct the reader mainly to review articles of the shorter type found in Trends journals. References can be accessed by scanning the QR code image at the end of each chapter. QR Code images are used throughout this book. QR Code is a registered trademark of DENSO WAVE INCORPORATED. If your mobile device does not have a QR Code reader try this website for advice www.mobile-barcodes.com/qr-code-software.

#### **Online Resource Centre**

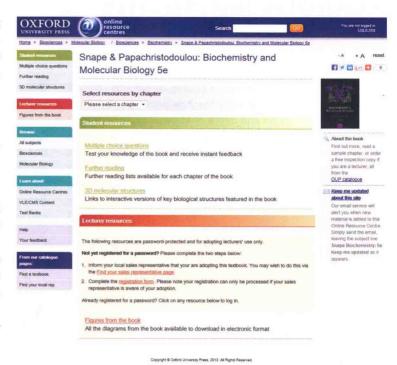

The Online Resource Centre, which has been built to accompany this text, contains a number of useful teaching and learning resources for lecturers and students. Visit the site at www.oxfordtextbooks. co.uk/orc/snape\_biochemistry5e/

For registered adopters of the book:

• Figures from the book available to download, for use in lectures and presentations.

#### For students:

- Comprehensive further reading lists, organized by chapter, and linked to relevant sections in the book via QR codes.
- An extensive bank of multiple-choice questions for self-directed learning. Each question has feedback keyed to the book so that students can review the relevant concepts easily.
- Links to three-dimensional structures of key biological molecules featured in the book.

### **Acknowledgements**

Our first and enormous debt is, of course, to Bill and Daphne Elliott, who developed and wrote the four previous editions of this book. Their breadth and depth of knowledge, their skill in organizing and explaining complex material in an accessible way, and their enthusiasm and capacity for keeping up to date with new developments across a range of subject areas are truly inspirational. They wrote to us most generously on hearing that we would take on the fifth edition, and we can only hope that we have learned from them sufficiently to maintain the standard they set. It was especially sad to hear that Bill Elliott died in July 2012, before we had a chance to meet, particularly since it turns out that he and AS also have their native county, Durham (UK) in common. The Elliotts acknowledged several colleagues for help with previous editions, and as we have retained much of the earlier structure and material, we have also without knowing them personally benefitted from their expertise and advice.

Our second major thanks go to the staff at Oxford University Press, Jonathan Crowe, who decided to let us loose on the book, and our editors, Holly Edmundson and Alice Mumford, who have guided us with patience, firmness, and good humour. We would also like to thank the members of the advisory and reviewing panels appointed by OUP who made many constructive suggestions for the development of

this edition and helpful comments on draft versions of some of our chapters.

Finally we would like to thank staff and students at King's College London. Our colleagues have contributed greatly to our knowledge and understanding of numerous topics, in particular Dr Liz Andrew, who reviewed Chapter 33 on the immune system. Professor Guy Tear, Dr Paul Brown, Dr Renee Tata and others have provided invaluable support and encouragement. Our students have persistently, and often perspicaciously, made comments and asked questions that have helped us develop our ability to teach.

It may metaphorically be said that natural selection is daily and hourly scrutinising, throughout the world, the slightest variations; rejecting those that are bad and adding up all that are good; silently and insensibly working, whenever and wherever opportunity offers, at the improvement of each organic being in relations to its organic and inorganic conditions of life.

Charles Darwin

Evolution is a tinkerer.

Francois Jacob

## **Abbreviations**

A	adenine	Cdk	cyclin-dependent kinase
AA	aminoacyl group	cDNA	complementary DNA
ABC	ATP-binding cassette	CETP	cholesterol ester transfer protein
ACAT	acyl-CoA:cholesterol acyltransferase	CGRP	calcitonin gene related peptide
ACP	acyl carrier protein	CJD	Creutzfeldt-Jakob disease
ACTH	adrenocorticotrophic hormone (also	CDP	cytidine diphosphate
	called corticotrophin)	Cki	Cdk inhibitor protein
ADH	antidiuretic hormone (also called	COP	coat protein (of transport vesicles)
	vasopressin)	CoA	coenzyme A (A = acyl)
ADP	adenosine diphosphate	CoQ	ubiquinone (see also Q, UQ)
AgAp	agouti-related appetite stimulant	COX	cyclooxygenase
Akt	protein kinase (see also PKB)	CRE	cAMP-response element
AIDS	acquired immunodeficiency syndrome	CREB	CRE-binding protein
ALA	5-aminolevulinic acid	CSF	colony-stimulating factor
ALA-S	aminolevulinate synthase	CTD	carboxy-terminal domain (of eukaryotic
ALT	alternative mechanism of lengthening	CID	RNA polymerase)
ALI	telomeres	CTP	cytidine triphosphate
AMP	adenosine monophosphate	CVD	cardiovascular disease
AMPK	AMP-activated protein kinase	CVD	cardiovascular disease
AP	apurine or apyrimidine	d-	deoxy (as in deoxyribonucleotides: dATP,
APC	antigen-presenting cell	u-	dCTP etc.)
APR	anaphase promoting complex	DAG	diacylglycerol
	apoptopic protease mediating factor	Da	Dalton (unit of atomic or molecular
Apaf-1 A site	acceptor site (or amino acyl site) of	Da	mass: one twelfth of the mass of a
A site	ribosome		carbon 12 atom)
ATCase		dd-	
ATCase	aspartyl transcarbamylase	du-	dideoxy (as in dideoxyribonucleotides: ddATP, ddCTP etc.)
ATP	ataxia telangiectasia mutated	DHAP	
	adenosine triphosphate		dihydroxyacetone phosphate
ARE	AU-rich element (in mRNA)	DNA	deoxyribonucleic acid
AZT	azidothymidine	DNase	deoxyribonuclease
DAG	1 1 1 1	DPE	downstream promoter element
BAC	bacterial artificial chromosome	ds	double stranded (DNA, RNA)
bp	base pair	DNP	dinitrophenol
BPG	2,3-bisphosphoglycerate	DSB	double stranded break
BSE	bovine spongiform encephalopathy (mad	n/	_1
	cow disease)	E <sub>0</sub>	redox potential value at pH 7.0
		ECM	extracellular matrix
C	cytosine	EF	elongation factor (in translation)
C-	'cellular', denotes protooncogene (c-ras, c-myc, etc.)	$EF_2$	elongation factor 2 (eukaryotic ribosomal translocase)
cal	calorie	EF-G	elongation factor-G (E. coli ribosomal
CAM	calmodulin		translocase)
cAMP	adenosine-3',5'-cyclic monophosphate	EF-Tu	elongation factor temperature unstable
CAK	Cdk activating kinase	EGF	epidermal growth factor
CAP	catabolite gene-activator protein	eIF	eukaryotic initiation factor
CBP	CREB-binding protein		(in translation)
CD	cluster of differentiation (proteins)	ELISA	enzyme-linked immunoabsorbent assay

		phosphoribosymansierase		IOHIZation

MAD		DI a l	
MAP	mitogen-activated protein (kinase)	PI 3-kinase	phosphatidylinositide 3-kinase
MHC	major histocompatibility complex	piRNA	piwi-interacting RNA
miRNA	microRNA	PK	protein kinase (PKA, PKB, PKC, etc.)
mRNA	messenger RNA	PK	pyruvate kinase
MS	mass spectrometry	$pK_a$	the pH at which there is 50% dissociation
MTOC	microtubule-organizing centre		of an acid
m/z	mass-to-charge ratio	PKB	mammalian homologue of Akt
		PKU	phenylketonuria .
N	unspecified base in a nucleotide (e.g. NTP)	PLC	phospholipase C
NAD+	nicotinamide adenine dinucleotide	PLP	pyridoxal-5'-phosphate
	(oxidized form)	Pol	DNA or RNA polymerase
NADH	reduced form of NAD	POMC	pro-opiomelanocortin; appetite repressor
NADP+	nicotinamide adenine dinucleotide	$PP_i$	inorganic pyrophosphate
	phosphate (oxidized form)	PPI	peptidylproline isomerase
NADPH	reduced form of NADP	Pq	plasto-quinone
N-CAMS	nerve cell adhesion proteins	PRE	polypyrimidine (C-rich) element
NEFA	non-esterified fatty acid		(in mRNA)
NES	nuclear export signal	pri-miRNA	primary microRNA
NF-κB	nuclear factor family of eukaryotic	PrPc	prion protein (constitutive)
	transcription factors	$PrP^{sc}$	prion protein (scrapie)
NGS	next generation sequencing	PRPP	5-phosphoribosyl-1-pyrophosphate
NK	natural killer cells	PS	phosphatidylserine
NLS	nuclear localization signal	PS	photosystem (PSI, PSII)
nm	nanometer (10 <sup>-9</sup> metres)	P site	peptidyl site (of ribosome)
NMR	nuclear magnetic resonance spectroscopy	PTGS	posttranscriptional silencing (plants)
NPY	neuropeptide Y; appetite stimulant	PTS	peroxisome-targeting signal
NSAID	nonsteroidal anti-inflammatory drugs	PYY-3-36	neuropeptide appetite inhibitor
NTF	nuclear transport factor	111000	neuropeptide appetite immotion
1111	indical transport factor	Q	ubiquinone (see also CoQ, UQ)
-®	high-energy phosphoryl group	Q	quadrupole (in mass spectrometry)
P450	cytochrome P450	qPCR	quantitative PCR (polymerase chain
PAGE	polyacrylamide gel electrophoresis	qr or	reaction)
PBG	porphobilinogen		reaction)
PC	phosphatidylcholine (lecithin)	R	gas constant (8.315 J mol <sup>-1</sup> K <sup>-1</sup> )
Pc	plastocyanin	Rb	retinoblastoma
PCNA	proliferating cell nuclear antigen	RFLP	restriction fragment length
FCNA		KILL	
PCR	(eukaryotic sliding clamp protein)	DE	polymorphism
	polymerase chain reaction	RF	release factor (in translation)
PDB	protein database	RISC	RNA-induced silencing complex
PDGF	platelet-derived growth factor	RNA	ribonucleic acid
PDH	pyruvate dehydrogenase	RNase	ribonuclease
PDI	protein disulfide isomerase	RNAi	RNA interference
PE	phosphatidylethanolamine (cephalin)	ROS	reactive oxygen species
PEP	phosphoenolpyruvate	R-5-P	ribose-5-phosphate
PEP-CK	PEP carboxykinase	RPA	replication protein A (detects single-
PET	positron emitting tomography		stranded DNA)
PFK	phosphofructokinase (PFK1, PFK2)	rRNA	ribosomal RNA
PG	prostaglandin	Rubisco	ribulose-1,5-bisphosphate carboxylase
3-PGA	3-phosphoglycerate		
PH	pleckstrin homology (domain)	S	Svedberg unit
$P_{i}$	inorganic phosphate	S	'synthesis' (DNA replication) phase of
pI	isoelectric point		cell cycle
PIAS	protein inhibitor of activated STATS	S	entropy
PIC	preinitiation complex	SAM	S-adenosylmethionine

membrane

SCID	severe combined immunodeficiency	TNF-α	tumour necrosis factor-α
JUL	disease	TOF	time of flight
SCNT	somatic cell-nuclear transfer	TOM	translocator of the outer mitochondrial
SECIS	selenocysteine insertion sequence		membrane
SDS	sodium dodecylsulfate	TPA (t-pa)	tissue plasminogen activator
SDS-PAGE	SDS polyacrylamide gel electrophoresis	TPP	thiamin pyrophosphate
SH2	Src homology region 2	tRNA	transfer RNA
SINES	short interspersed elements	tRNAphe	tRNA specific for phenylalanine
siRNA	small interfering RNA		(by analogy, tRNA <sup>Leu</sup> , tRNA <sup>Met</sup> , etc.)
Sn	stereospecific numbering	$tRNA_f$	tRNA formyl (bacterial translation
SNP	single nucleotide polymorphism	tititi	initiation)
snRNAs	small nuclear RNAs	tRNA,	tRNA for eukaryote translation initiation
snoRNA	small nucleolar RNA	TSH	thyroid-stimulating hormone
SOCS	suppressors of cytokine signalling	1311	thyroid-stilldiating hormone
SOS	'son of sevenless'	U	uracil
SR	sarcoplasmic reticulum	UDP	uridine diphosphate
SRP	signal-recognition particle	UDPG	uridine diphosphoglucose
Ss	sigle-stranded (DNA or RNA)	UDP-Gal	uridine diphosphogalactose
SSB	single-stranded (DVA of RVA)	UTP	uridine triphosphate
STAT	signal transducer and activator of	UQ	ubiquinone (see also CoQ, Q)
SIMI	transcription	UTR	untranslated region (of mRNA)
STR	short tandem repeats (microsatellites)	UV	ultraviolet (light)
SIK	short tandem repeats (inicrosatemies)	UV	ditraviolet (fight)
T	thymine	V-	'viral', denotes oncogene (v-ras, v-myc, etc.)
$T_3$	triiodothyronine	V	velocity of reaction
$T_4$	thyroxine	V0	initial velocity of reaction
TAF	TBP-associated factor	$V_{max}$	maximum velocity of reaction
TAG	triacylglycerol	VLDL	very-low-density lipoprotein
TBP	TATA-binding protein	VNTR	variable number of tandem repeats
TCA	tricarboxylic acid		1
TCR	T cell receptor	X-5-P	xylulose-5-phosphate
TF	transcription factor		
TFIID	transcription factor D for RNA	YAC	yeast artificial chromosome
	polymerase II		
TIM	translocator of the inner mitochondrial		
	1		

### **Contents**

Diseases and medically relevant topics	xxiii	Proteomics and genomics	13
Abbreviations	XXV	Summary	13
		Further reading	15
		Problems	15
Part 1 Basic concepts of life	е	Chapter 2 Cells and viruses	16
		Cells are the units of all living systems	16
Chapter 1 The basic molecular themes of life	3	• What determines the size of cells?	16
All life forms are similar at the molecular level		Classification of organisms	16
The energy cycle in life	3	Prokaryotic cells	17
The laws of thermodynamics deal with energy	4	Eukaryotic cells	18
Energy can be transformed from one state to another	5	Basic types of eukaryotic cells	21
ATP (adenosine triphosphate) is the universal energy		Viruses	23
currency in life	5	Summary	25
Types of molecules found in living cells	5	Further reading	26
Small molecules	6	Problems	26
<ul> <li>Macromolecules are made by polymerization of smaller units</li> </ul>	7		
Protein and nucleic acid molecules have information content	7	Chapter 3 Energy considerations in biochemistry	27
Proteins	8	Chapter 3 Lifergy considerations in biochemistry	21
Catalysis of reactions by enzyme proteins is central to the existence of life	8	<ul> <li>Energy considerations determine whether a chemical reaction is possible in the cell</li> </ul>	27
<ul><li>What is the function of enzymes?</li></ul>	8	• Reversible and irreversible reactions and $\Delta G$ values	28
Proteins work by molecular recognition	9	<ul> <li>The importance of irreversible reactions in the strategy of metabolism</li> </ul>	29

• Fats	148	<ul> <li>The emergency situation – fight or flight</li> </ul>	170
Carbohydrates	149	Summary	170
• Vitamins	149	Further reading	171
Guidelines for a healthy diet	152	Problems	171
Regulation of food intake	152		
<ul> <li>Hunger appetite and satiety</li> </ul>	152	Chapter 11 Mechanisms of transport,	
<ul> <li>Integration of hunger and satiety signals by the hypothalamus</li> </ul>	153	storage, and mobilization of dietary components	173
Summary	154	Glucose traffic in the body	173
Further reading	155	Mechanism of glycogen synthesis	173
Problems	155	Breakdown of glycogen to release glucose into the blood	175
		Key issues in the interconversion of glucose and glycogen	177
		<ul> <li>The liver has glucokinase and the other tissues, hexokinase</li> </ul>	177
Chapter 10 Food digestion, absorption, and		• What happens to other sugars absorbed from the intestine?	179
distribution to the tissues	156	Amino acid traffic in the body (in terms of fuel logistics)	180
Chemistry of foodstuffs	156	Fat and cholesterol movement in the body: an overview	181
Digestion and absorption	157	<ul> <li>Utilization of cholesterol in the body</li> </ul>	181
<ul> <li>Anatomy of the digestive tract</li> </ul>	158	Fat and cholesterol traffic in the body: lipoproteins	182
<ul> <li>What are the energy considerations in digestion and absorption?</li> </ul>	158	Apolipoproteins	182
<ul> <li>A major problem in digestion – why doesn't the body digest itself?</li> </ul>	158	<ul> <li>Lipoproteins involved in fat and cholesterol movement in the body</li> </ul>	183
		<ul> <li>Metabolism of chylomicrons</li> </ul>	183
Digestion of proteins	158	<ul> <li>Metabolism of VLDL: TAG and cholesterol transport from</li> </ul>	400
HCl production in the stomach	159	the liver	183
Pepsin, the proteolytic enzyme of the stomach	159	<ul> <li>Release of FFA from adipose cells</li> <li>How are FFA carried in the blood?</li> </ul>	188 188
Completion of protein digestion in the small intestine	159	How are FFA carried in the blood:	100
Activation of the pancreatic proenzymes	160	Summary	189
<ul> <li>Absorption of amino acids into the bloodstream</li> </ul>	160	Further reading	189
Digestion of carbohydrates	161	Problems	190
<ul> <li>Structure of carbohydrates</li> </ul>	161		
• Digestion of starch	161	Chapter 12 Principles of energy release from food	191
<ul> <li>Digestion of sucrose</li> </ul>	162		
<ul> <li>Digestion of lactose</li> </ul>	162	Overview of glucose metabolism	191
Absorption of monosaccharides	163	<ul> <li>Biological oxidation and hydrogen-transfer systems</li> </ul>	191
Digestion and absorption of fat	163	Energy release from glucose	193
<ul> <li>Resynthesis of TAG in intestinal cells</li> </ul>	164	<ul> <li>The main stages of glucose oxidation</li> </ul>	193

Digestion of other components of food

Storage of food components in the body

Stage 1 in the release of energy from glucose: glycolysis
