Incompressible Flow

Preface

This book is written as a textbook for students beginning a serious study of fluid dynamics, or for students in other fields who want to know the main ideas and results in this discipline. A reader who judges the scope of the book by its title will be somewhat surprised at the contents. The contents not only treat incompressible flows themselves, but also give the student an understanding of how incompressible flows are related to the general compressible case. For example, one cannot appreciate how energy interactions occur in incompressible flows without first understanding the most general interaction mechanisms. I subscribe to the philosophy that advanced students should study the structure of a subject as well as its techniques and results. The beginning chapters are devoted to building the concepts and physics for a general, compressible, viscous fluid flow. These chapters taken by themselves constitute the fundamentals that one might study in any course concerning fluid dynamics. Beginning with Chapter 6 our study is restricted to fluids that obey Newton's viscosity law. Only when we arrive at Chapter 10 do we find a detailed discussion of the assumptions that underlie the subject of incompressible flow. Thus, roughly half the book is fundamentals, and the rest is incompressible flow.

Applied mathematicians have contributed greatly to the study of fluid mechanics, and there is a tendency to make a text into a sampler of known mathematical solutions. A conscious effort was made in writing the book to strike an even balance among physics, mathematics, and practical engineering information. The student is assumed to have had calculus and differential equations; the text then takes on the task of introducing tensor analysis in index notation, as well as various special methods of solving differential equations that have been developed in fluid mechanics. This includes an introduction to several computer methods and the method of asymptotic expansions.

The book places heavy emphasis on dimensional analysis, both as a subject in itself and as an instrument in any analysis of flow problems. The advanced worker knows many shortcuts in this area, but the student needs to study the foundations and details in order to be convinced that these shortcuts are valid. Vorticity, vortex lines, and the dynamics of vorticity also receive an expanded treatment, which is designed to bring the serious student more information than is customary in a textbook. It is apparent that advanced workers in fluid

mechanics must be able to interpret flow patterns in terms of vorticity as well as in the traditional terms of forces and energy.

The study of how changes in the Reynolds number influence flow patterns occupies a large part of the book. Separate chapters describe flows at low, moderate, and high Reynolds numbers. Because of their practical importance, the complementary subjects of inviscid flows and boundary-layer flows are treated extensively. Introductory chapters on stability and turbulence are also given. These last two subjects are so large as to constitute separate fields. Nevertheless, a beginning student should have an overview of the rudiments and principles.

The book is not meant to be read from front to back. The coverage is rather broad so that the instructor may select those chapters and sections that suit his or her goals. For example, I can imagine that many people, considering the level and background of their students, will skip Chapter 2 on thermodynamics or Chapter 3 on tensor index notation. I placed these chapters at the beginning, rather than in an appendix, with the thought that the student would be likely to review these subjects even if they were not formally assigned as a part of the course. Students who want more information about any chapter will find a supplemental reading list at the back of the book.

A chapter usually begins with an elementary approach suitable for the beginning student. Subsections that are marked by an asterisk contain more advanced material, which either gives a deeper insight or a broader viewpoint. These sections should be read only by the more advanced student who already has the fundamentals of the subject well in hand. Likewise, the problems at the end of each chapter are classified into three types: (A) problems that give computational practice and directly reinforce the text material, (B) problems that require a thoughtful and more creative application of the material, and finally (C) more difficult problems that extend the text or give new results not previously covered.

Several photographs illustrating fluid flow patterns have been included. Some illustrate a simplified flow pattern or single physical phenomenon. Others were chosen precisely because they show a very complicated flow that contrasts with the simplified analysis of the text. The intent is to emphasize the nonuniqueness and complexity possible in fluid motions. In most cases only the major point about a photograph is explained. The reader will find a complete discussion in the original references.

Writing this book has been a long project. I would like to express my appreciation for the encouragement that I have received during this time from my family, students, colleagues, former teachers, and several anonymous reviewers. The people associated with John Wiley & Sons should also be mentioned: At every stage their professional attitude has contributed to the quality of this book.

Incompressible Flow

Contents

1	Continuum Mechanics	1
1.1	The Continuum Assumption	3
1.2	Fundamental Concepts, Definitions, and Laws	4
1.3	Space and Time	5
1.4	Density, Velocity, and Internal Energy	7
1.5	The Interface Between Phases	11
1.6	Conclusion	14
	Problems	15
2	Thermodynamics	17
2.1	Systems, Properties, and Processes	18
2.2	The Independent Variables	20
2.3	Temperature and Entropy	21
2.4	Fundamental Equation of a Substance	23
2.5	Definition of Temperature, Pressure, and Chemical Potential	24
2.6	Composite Systems and Internal Constraints	25
2.7	The Basic Postulate of Thermodynamics	27
2.8	Characteristics of the Temperature	30
2.9	Characteristics of the Pressure	31
2.10	Euler's Equation for Homogeneous Functions	33
2.11	The Gibbs–Duhem Equation	34
2.12	Alternate Forms of the Fundamental Equation	35
2.13	Intensive Forms	35
2.14	The Perfect Gas	37
2.15	Maxwell Relations	40
2.16	Working Equations	41
2.17	The Speed of Sound	43
2.18	Incompressible Substance	45
2.19	Conclusion	46
	Problems	47

3	Vector Calculus and Index Notation	50
3.1	Rotation of Axes	51
3.2	Definition of Vectors	56
3.3	Algebra with Vectors	57
3.4	Definition of Tensors	59
3.5	Symmetric and Antisymmetric Tensors	62
3.6	Algebra with Tensors	64
3.7	Vector Cross Product	66
3.8	Derivative Operations	67
3.9	Integral Formulas of Gauss and Stokes	71
3.10	Leibnitz's Theorem	73
3.11	Conclusion	75
	Problems	76
4	Kinematics of Local Fluid Motion	78
4.1	Lagrangian Viewpoint	78
4.2	Eulerian Viewpoint	82
4.3	Substantial Derivative	84
4.4	Decomposition of Motion	86
4.5	Elementary Motions in a Linear Shear Flow	90
*4.6	Proof of Vorticity Characteristics	92
*4.7	Rate-of-Strain Characteristics	94
4.8	Rate of Expansion	96
*4.9	Streamline Coordinates	97
4.10	Conclusion	99
	Problems	99
5	Basic Laws	102
5.1	Continuity Equation	102
5.2	Momentum Equation	106
5.3	Surface Forces	107
*5.4	Stress-Tensor Derivation	108
5.5	Interpretation of the Stress-Tensor Components	110
5.6	Pressure and Viscous Stress Tensor	112
5.7	Differential Momentum Equation	114
*5.8	Angular-Momentum Equation and Symmetry of T_{ij}	119
5.9	Energy Equation	121
5.10	Mechanical- and Thermal-Energy Equations	124
5.11	Energy Equation with Temperature as Dependent Variable	126
*5.12	Second Law of Thermodynamics	126
5.13	Integral Form of the Continuity Equation	127

- 5.14 Integral Form of the Momentum Equation 129
- *5.15 Momentum Equation for a Deformable Particle of Variable Mass 130
- *5.16 Other Physical Laws in Integral Form 134
- 5.17 Conclusion 135
- Problems 136

6 Newtonian Fluids and the Navier–Stokes Equations

139

- 6.1 Newton's Viscosity Law 139
- 6.2 Molecular Model of Viscous Effects 142
- 6.3 Non-Newtonian Liquids 146
- *6.4 The No-Slip Condition 149
- 6.5 Fourier's Heat-Conduction Law 152
- 6.6 Navier–Stokes Equations 154
- 6.7 Conclusion 155
- Problems 155

7 Some Incompressible Flow Patterns

157

- 7.1 Pressure-Driven Flow in a Slot 157
- 7.2 Plane Couette Flow 167
- 7.3 Pressure-Driven Flow in a Slot with a Moving Wall 168
- 7.4 Double Falling Film on a Wall 170
- 7.5 The Rayleigh Problem 173
- 7.6 Conclusion 179
- Problems 179

8 Dimensional Analysis

181

- 8.1 Measurement and Dimensions 182
- 8.2 Variables and Functions 185
- 8.3 The Pi Theorem 188
- 8.4 Pump or Blower Analysis 192
- 8.5 Number of Primary Dimensions 196
- *8.6 Proof of Bridgman's Equation 201
- *8.7 Proof of the Pi Theorem 203
- *8.8 Vector Length Scales (Distinguished Directions) 207
- *8.9 Generalized Millikan Argument 209
- 8.10 Dynamic Similarity 215
- 8.11 Nondimensional Formulation of Physical Problems 220
- 8.12 Conclusion 226
- Problems 227

9	Compressible Couette Flow	229
9.1	Compressible Couette Flow; Adiabatic Wall	229
9.2	Flow with Power-Law Transport Properties	233
9.3	Nonuniqueness of Navier–Stokes Solutions	234
9.4	Conclusion	236
	Problems	236
10	Incompressible Flow	237
10.1	Characterization	237
10.2	Incompressible Flow as a Low-Mach-Number Flow with Adiabatic Walls	238
10.3	Nondimensional Problem Statement	240
10.4	Characteristics of Incompressible Flow	244
10.5	Splitting the Pressure into Hydrodynamic and Hydrostatic Parts	247
*10.6	Mathematical Aspects of the Limit Process $M^2 \rightarrow 0$	250
*10.7	Invariance of Incompressible-Flow Equations under Unsteady Motion	252
*10.8	Low-Mach-Number Flows with Constant-Temperature Walls	254
*10.9	The Energy-Equation Paradox	258
10.10	Conclusion	260
	Problems	261
11	Flows that are Exact Solutions of the Navier–Stokes Equations	262
11.1	Pressure-Driven Flow in Tubes of Various Cross Sections; An Elliptical Tube	263
11.2	Stokes Oscillating Plate	266
*11.3	Transient for Stokes Oscillating Plate	272
*11.4	Starting Transient for Plane Couette Flow	275
11.5	Flow in a Slot with an Oscillating Pressure Gradient	279
11.6	Decay of an Ideal Line Vortex (Oseen Vortex)	283
11.7	Stagnation-Point Flow (Hiemenz Flow)	288
11.8	von Kármán’s Viscous “Pump”	296
11.9	Conclusion	300
	Problems	301
12	Stream Functions and the Velocity Potential	303
12.1	Stream Function for Plane Flows	303
*12.2	Streamlines and Streamsurfaces for a Three-Dimensional Flow	308

- 12.3 Velocity Potential and Unsteady Bernoulli Equation 315
- 12.4 Growth of a Gas Bubble in a Liquid 316
- 12.5 Flow in an Ideal Vortex—Circulation 318
- 12.6 Conclusion 320
- Problems 321

13 Vorticity Dynamics

322

- 13.1 Vorticity 322
- 13.2 Kinematic Results Concerning Vorticity 323
- 13.3 The Vorticity Equation 327
- 13.4 Vorticity Diffusion 328
- 13.5 Vorticity Intensification by Straining Vortex Lines 330
- 13.6 Hill's Spherical Vortex 332
- 13.7 Wall Production of Vorticity 334
- 13.8 How Vorticity Distributions are Established 337
- 13.9 Inviscid Motion of Line Vortices 342
- 13.10 Kelvin's Theorem and Helmholtz's Theorem 343
- *13.11 Integral Vorticity Equations 346
- 13.12 Conclusion 347
- Problems 348

14 Kinematic Decomposition of Flow Fields

349

- *14.1 General Approach 349
- *14.2 Helmholtz's Decomposition 350
- *14.3 Line Vortex and Vortex Sheet 352
- *14.4 Complex-Lamellar Decomposition 354
- *14.5 Conclusion 357
- Problems 358

15 Flows at Moderate Reynolds Numbers

359

- 15.1 Some Unusual Flow Patterns 360
- 15.2 Entrance Flows 365
- 15.3 Entrance Flow into a Cascade of Plates: Computer Solution by the Stream-Function–Vorticity Method 366
- 15.4 Entrance Flow into a Cascade of Plates: Pressure Solution 377
- 15.5 Entrance Flow into a Cascade of Plates: Results 378
- 15.6 Flow around a Circular Cylinder 384
- 15.7 Conclusion 401
- Problems 401

16	Asymptotic Analysis Methods	403
16.1	Oscillation of a Gas Bubble in a Liquid	403
16.2	Order Symbols, Gauge Functions, and Asymptotic Expansions	406
16.3	Inviscid Flow over a Wavy Wall	410
*16.4	Nonuniform Expansions	414
*16.5	Matched Asymptotic Expansions: Friedrich's Problem	417
*16.6	The Matching Process	420
*16.7	Composite Expansions; Accuracy	425
16.8	Conclusion	427
	Problems	427
17	Characteristics of High-Reynolds-Number Flow	429
17.1	Physical Motivation	429
17.2	Inviscid Main Flows	431
17.3	Pressure Changes in Flows	435
17.4	Boundary Layers	439
17.5	Conclusion	449
	Problems	450
18	Ideal Flows in a Plane	451
18.1	Problem Formulation for Plane Ideal Flows	452
18.2	Simple Plane Flows	456
18.3	Line Source and Line Vortex	460
18.4	Flow over a Nose or a Cliff	462
18.5	Doublets	468
18.6	Cylinder in a Stream	471
18.7	Cylinder with Circulation in a Uniform Stream	473
18.8	Lift and Drag on Two-Dimensional Shapes	476
18.9	Magnus Effect	479
18.10	Conformal Transformations	481
18.11	Joukowski Transformation; Airfoil Geometry	486
18.12	Kutta Condition	493
18.13	Flow Over a Joukowski Airfoil	495
18.14	Airfoil Lift	502
*18.15	Schwarz-Christoffel Transformation	508
*18.16	Flow around a Square Body or Over a Step	510
*18.17	Diffuser or Contraction Flow	515
*18.18	Gravity Waves in Liquids	520
18.19	Conclusion	526

19 Axisymmetric and Three-Dimensional Ideal Flows**529**

- 19.1 General Equations and Characteristics of Three-Dimensional Ideal Flows 529
- 19.2 Swirling Flow Turned into an Annulus 531
- 19.3 Flow over a Weir 533
- 19.4 Point Source 535
- 19.5 Rankine Nose Shape 536
- 19.6 Experiments on the Drag of Slender Shapes 539
- 19.7 Flow from a Doublet 542
- 19.8 Flow over a Sphere 544
- 19.9 D'Alembert's Paradox 546
- 19.10 Induced Drag 548
- 19.11 Lifting-Line Theory 553
- 19.12 Added Mass 554
- 19.13 Conclusion 559
- Problems 560

20 Boundary Layers**561**

- 20.1 Blasius Flow over a Flat Plate 561
- 20.2 Displacement Thickness 567
- 20.3 Kármán Momentum Integral 569
- 20.4 Kármán-Pohlhausen Approximate Method 570
- 20.5 Falkner-Skan Similarity Solutions 572
- 20.6 Arbitrary Two-Dimensional Layers: Crank-Nicolson Difference Method 577
- *20.7 Vertical Velocity 587
- 20.8 Joukowski-Airfoil Boundary Layer 590
- 20.9 Boundary Layer on a Bridge Piling 594
- 20.10 Boundary-Layer Separation 596
- 20.11 Axisymmetric Boundary Layers 599
- 20.12 Jets 602
- 20.13 Far Wake of Nonlifting Bodies 605
- 20.14 Shear Layers 608
- *20.15 Asymptotic Theory and Matching 610
- *20.16 Entrance Flow into a Cascade 615
- *20.17 Three-Dimensional Boundary Layers 618
- *20.18 Boundary Layer with a Constant Transverse Pressure Gradient 622
- *20.19 Howarth's Stagnation Point 627
- *20.20 Separation 630
- 20.21 Conclusion 635
- Problems 636

21 Low-Reynolds-Number Flows 638

- 21.1 General Relations for $Re \rightarrow 0$; Stokes Equations 638
- 21.2 Global Equations for Stokes Flow 642
- 21.3 Stokes Flow over a Sphere 644
- *21.4 Nonuniformity of Stokes Flows on Infinite Domains 647
- *21.5 Stokes Flow over Fluid Spheres 649
- *21.6 Stokes Flow over Particles of Arbitrary Shape 652
- *21.7 Interference Effects 655
- 21.8 Flow in Tubes and Channels with Varying Cross Sections 657
- 21.9 Reynolds Equations for Lubrication Theory 659
- 21.10 Slipper-Pad Bearing 662
- *21.11 Squeeze Film Lubrication; Viscous Adhesion 664
- *21.12 Local Flow Solutions 665
- *21.13 Stokes Flow near a Circular Cylinder 668
- *21.14 Oseen's Equations 669
- 21.15 Conclusion 671
- Problems 671

22 Introduction to Stability 673

- 22.1 Normal Modes as Perturbations 674
- 22.2 Kelvin-Helmholtz Inviscid Shear-Layer Instability 675
- 22.3 Stability Problem for Nearly Parallel Viscous Flows 679
- 22.4 Orr-Sommerfeld Equation 682
- 22.5 Inviscid Stability of Nearly Parallel Flows 684
- 22.6 Viscous Stability of Nearly Parallel Flows 685
- 22.7 Experimental Verification of Stability Theory 688
- 22.8 Inviscid Instability of Flows with Curved Streamlines 692
- 22.9 Taylor Instability of Couette Flow 694
- 22.10 Stability of Regions of Concentrated Vorticity 699
- 22.11 Some Other Instabilities 701
- 22.12 Conclusion 703

23 Introduction to Turbulent Flows 704

- 23.1 Types of Turbulent Flows 704
- 23.2 Characteristics of Turbulent Flows 705
- 23.3 Transition 709
- 23.4 Reynolds Decomposition 711
- *23.5 Correlations of Fluctuations 713
- 23.6 Distinctive Regions of a Wall Layer 715
- 23.7 Reynolds Stress 722
- *23.8 Kinetic Energy 724

*23.9	Energy Spectrum	726
23.10	Equilibrium Boundary Layers	728
23.11	Structure of Wall-Layer Turbulence	730
23.12	Jets, Wakes, and Free Shear Layers	733
23.13	Conclusion	740
APPENDIX A	Properties of Fluids	741
APPENDIX B	Differential Operations in Cylindrical and Spherical Coordinates	742
APPENDIX C	Basic Equations in Rectangular, Cylindrical, and Spherical Coordinates	746
APPENDIX D	Streamfunction Relations in Rectangular, Cylindrical, and Spherical Coordinates	752
APPENDIX E	Computer Code for Runge–Kutta Integration	754
APPENDIX F	Computer Code for Entrance Flow into a Cascade	759
APPENDIX G	Computer Code for Boundary-Layer Analysis	761
	Supplemental Reading List	764
	References	766
	Index	773

1 Continuum Mechanics

The science of fluid dynamics describes the motions of liquids and gases and their interaction with solid bodies. There are many ways to further subdivide fluid dynamics into special subjects. The plan of this book is to make the division into compressible and incompressible flows. Compressible flows are those where changes in the fluid density are important. The major specialty concerned with compressible flows is called gas dynamics. It deals with high-speed flows where density changes are large and wave phenomena frequently occur. Incompressible flows, of either gases or liquids, are flows where density changes in the fluid are not an important part of the physics. The study of incompressible flow includes such subjects as hydraulics, hydrodynamics, aerodynamics, and boundary-layer theory. It also contains the background information for such special subjects as hydrology, lubrication theory, stratified flows, turbulence, rotating flows, and biological fluid mechanics. Incompressible flow not only occupies the central position in fluid dynamics, but is also fundamental to the practical subjects of heat and mass transfer.

Figure 1-1 shows a photograph of a ship's propeller being tested in a water tunnel. The propeller is rotating, and the water flow is from left to right. The most prominent feature of this photograph is the line of vapor which leaves the tip of each blade and spirals downstream. The vapor is not itself important, but it marks a region of very low pressure in the core of a vortex which leaves the tip of each blade. This vortex would exist even if the pressure were not low enough to form water vapor. The convergence of the vapor lines into a smaller spiral indicates that the flow is faster behind the propeller than in front of the propeller.

A photograph of an airplane in level flight is shown in Fig. 1-2. A smoke device has been attached to the wing tip so that the core of the vortex formed there is made visible. The vortex trails nearly straight back behind the aircraft. From the sense of the vortex we may surmise that the wing is pushing air down on the inside while air rises outside the tip.

There are obviously some differences in these two situations. The wing moves in a straight path, whereas the ship's propeller blades are rotating. The propeller operates in water, a nearly incompressible liquid, whereas the wing operates in air, a very compressible gas. The densities of these two fluids differ by a factor of 800 : 1. In spite of these obvious differences, these two flows are governed by the same laws, and their fluid dynamics are very similar. The purpose of the wing is to lift the airplane, while the purpose of the propeller is to produce thrust on the boat. The density of the air as well as that of the
