COLLEGE CHEMISTRY

Chemistry—Study and Teaching
(higher)

**The Merrill Physical and Inorganic
Chemistry Series**

Theodore L. Brown, Editor
University of Illinois

PREFACE

The aim of *College Chemistry* is to present the basic concepts involved in the study of chemistry in a way that will enable a student to correlate some of the vast amount of chemical information. The emphasis on fundamental concepts gives a student experience with the methods and logic of chemistry. Descriptive chemistry is used to exemplify and introduce concepts. This integration of descriptive chemistry at appropriate points promotes the view that empirical observations are neither apart from nor independent of theoretical discussion.

The presentation of modern chemistry to students who have had a previous course in chemistry has been done well by other people. *College Chemistry* assumes no such experience. It is written for students in any of three broad types of courses: (1) A terminal course for non-science majors; (2) A one-semester preparatory course for those students who intend to move into a course specifically for science majors; (3) A one-year course in which both science and non-science majors are enrolled.

The task of preparing the science majors for additional courses in chemistry while giving the non-science majors some understanding and appreciation of chemistry is a difficult one. *College Chemistry* is designed to help remove some of this difficulty. The more advanced topics such as thermodynamics, kinetics, activities, and electrochemistry are presented in a manner simple enough that non-science majors can grasp the concepts. At the discretion of the instructor the concepts may then be applied, or

extended readily to the depth necessary, for any particular group of students. As an example, molecular geometry is explained in terms of electron-pair repulsion. This seems reasonable for any student with even a slight knowledge of simple electrostatics. The additional or alternative explanation in the terms of hybridization of orbitals, though more abstract, can be comprehended after sufficient discussion.

In the interest of allowing the instructor to tailor the book to his course, the later chapters—particularly those after Chapter 8—are relatively self-contained. Although the presentation of topics does not presuppose a course in high school chemistry, it does depend on some knowledge of basic algebra.

For electrochemical processes the IUPAC convention has been used for the standard electrode potentials, and qualitative use has been made of the Nernst equation.

The appendices have been designed to allow for the extension of text material. For example, comparatively extensive tables of data are available for the writing of additional problems by the instructor. These data are, of course, readily accessible to the student. The description of many industrial processes and laboratory syntheses should provide a source of additional descriptive chemistry.

I gratefully acknowledge the encouragement and patience of the Merrill staff, especially Pat Hearne. I also want to acknowledge the truly incomparable assistance of Ruth Green, who put in the long hours necessary to type the manuscript.

In the interest of future printings and editions, I should greatly appreciate any notices of error and suggestions for changes.

San Francisco
February, 1966

Chapter 1

MATTER, ENERGY, AND MEASUREMENT

1

Introduction	1
Matter	2
Energy	4
Mass-energy equivalence	5
Measurement	6
The metric system	11
Conversion factors	12
Dimensional analysis	14
Complex measurements	14
Significant figures	16
Rules for significant figures in arithmetic operations	18
Exponential notation	19
Properties and changes of matter	21
Problems	22

Chapter 2

CHEMICAL SYMBOLISM

29

Symbols and formulas	29
Oxidation numbers	32

Nomenclature	34
Balancing chemical equations	35
Energy changes in a chemical reaction	39
Problems	40

*Chapter 3***ATOMIC THEORY****46**

Origin of the atomic theory	46
Empirical laws	47
Dalton's atomic theory	48
The law of multiple proportions	48
The electron	50
The proton	54
The neutron	54
The Rutherford atom	55
Atomic mass and atomic weight	57
Avogadro's number and the mole	60
Percentage composition	63
Molecular and empirical formulas	65
Problems	67

*Chapter 4***STOICHIOMETRY****71**

Introduction	71
The mole method	72
Stoichiometry involving gases	77
Energy changes in a chemical reaction	80
Heat of reaction	82
Problems	83

*Chapter 5***GASES****87**

The kinetic molecular theory	87
Pressure	89
Temperature	90
The ideal gas	94
Boyle's law	96
Dalton's law of partial pressures	98
Charles' law	102

Combined gas law	106
Avogadro's principle	108
Graham's law of diffusion	109
Gas density and molecular weight determination	111
Behavior of real gases	114
Problems	115

*Chapter 6***ELECTRONIC STRUCTURE****122**

The hydrogen atom	122
The photoelectric effect	125
deBroglie's hypothesis	126
Heisenberg's uncertainty principle	128
The wave equation	130
Quantum numbers	132
The <i>Aufbau</i> principle	137
Electron-dot formulas	143
Problems	144

*Chapter 7***CHEMICAL PERIODICITY****147**

Early attempts at classification	147
Electron configuration and the periodic table	151
Periods and families	155
Surveying the table	158
Example of periodicity in the third period	159
Periodicity in the families	162
Problems	166

*Chapter 8***THE CHEMICAL BOND****168**

The covalent bond	168
Ionization energy	177
Electronegativity	180
Polarity	182
The ionic bond	182
The metallic bond	184
Problems	185

*Chapter 9***CHANGES OF STATE****188**

States of matter	188
The van der Waals forces	189
Critical temperature	191
Equilibrium vapor pressure	192
Changes of state	195
Phase diagrams	197
Heats of fusion and vaporization	198
Le Chatelier's principle	201
Hydrogen bonding	203
Problems	206

*Chapter 10***CRYSTAL STRUCTURE****209**

Unit cells and space lattices	209
Determination of crystal structure	217
Some important crystal structures	218
Isomorphism, polymorphism, and amorphism	223
Allotropy	225
Hydrated crystals	226
Problems	227

*Chapter 11***SOLUTIONS****229**

Classification of solutions	229
Solution rate	234
Heat of solution	235
Crystallization and purification	238
Electrolytes and ionization	240
Concentration units	241
Colligative properties of solutions	248
Experimental determination of molecular weight	252
Ion activity	253
Problems	254

*Chapter 12***ACIDS AND BASES****258**

Arrhenius' theory of acids and bases	258
The Brönsted-Lowry theory	259
The Lewis theory	260
General properties of acids and bases	263
Nomenclature of acids and bases	264
Acid and basic anhydrides	266
Strengths of acids and bases	267
Solutions of salts of strong acids and strong bases	268
Solutions of salts of strong acids and weak bases	269
Solutions of salts of weak acids and strong bases	269
Hydrolysis	269
Equivalents and equivalent weights	271
Normality of acids and bases	273
Titration and the pH scale	275
Problems	281

*Chapter 13***CHEMICAL KINETICS AND CHEMICAL EQUILIBRIUM** **285**

Reaction rate	285
Factors affecting the reaction rate	286
The law of mass action and the equilibrium constant	295
Le Chatelier's principle	297
Irreversible reactions	305
Ionization of weak electrolytes	306
Common-ion effect	310
Ionization of water	312
Hydrolysis	314
Buffer solutions	315
Solubility-product constant	317
Problems	320

*Chapter 14***OXIDATION-REDUCTION****324**

Classification of reactions	324
Oxidation numbers	325
Balancing redox equations	329

Equivalents and equivalent weights	336
Stoichiometry of redox reactions	339
Redox titrations	340
Problems	342

*Chapter 15***ELECTROCHEMISTRY 346**

Electrical conductivity	346
Electrolytic conductivity	347
Electrode reactions in electrolysis	348
Quantitative aspects of electrolysis	351
Galvanic cells	353
Electrode potentials	356
Qualitative use of standard electrode potentials	360
Equilibrium constants from E^0 values	365
Some applications of electrochemistry	367
Problems	372

*Chapter 16***COORDINATION CHEMISTRY 374**

Complex ions	375
Coordination number and geometry	376
Ligand-metal ion bonding	378
Types of ligands; nomenclature	378
Exchange of ligands	381
Stability of complexes	382
Uses of coordination compounds	385
Problems	386

*Chapter 17***ORGANIC CHEMISTRY 387**

Bonding	387
Alkanes	388
Cycloalkanes	391
Alkenes	392
Alkynes	395
Aromatic hydrocarbons	396
Halogen derivatives	397
