Integrated Subsea Services Ltd

The Subsea Specialists

Integrated Subsea Services own and operate a modern fleet of ROVs, including both Workclass ROVs and Inspection Class ROVs to perform such tasks as inspection, repair and maintenance programmes, platform inspection, pipeline inspection, construction support, diver observation and drill support ROV services, for independent and major oil and gas operators/contractors.

The ISS ROV fleet includes the following type of systems:

Inspection Class:

- SeaEye Tiger (1000m)
- Mohawk (1200m)
- Super Mohawk (2000m)
- Mohican (2000m)

Workclass:

- MRV (1000m)
- Comanche (2000m/3000m)
- Triton XLS (3000m)
- Triton XLX (3000m/4000m)

Integrated Subsea Services Ltd

Welcome to the ninth edition of **Remotely Operated Vehicles of the World** – the most comprehensive and informative industry reference document available.

At the time of writing this introduction the world is just emerging, hopefully, from the brink of financial catastrophe – or the credit crunch as it is known. As with all industries this has affected the ROV/AUV market with a number of operators going to the wall, cuts in budgets and a lack of confidence reducing orders. However, all the signs suggest this will be more of a 'blip' than a long term depression for our market. The price of oil has remained high and continues to increase as world demand places pressure on supply. The offshore oil and gas industry will continue to be the main market for our industry. The move to look for oil in ever deeper water and subsea production will be the key technology drivers.

What will be key trends in technology development over the next decade? Over recent times there has been a trend of increasing power in electro-hydraulic Work class ROVs to the point where you have to question the motives. I think we will begin to see demand for more compact systems with greater capability. Electric ROVs continue to increase in size and power, and we are starting to see all electric tools and manipulators being marketed. The all electric ROV presents a big opportunity for future development.

ROV control systems have developed greatly in the past decade. Features to aid pilots such as dynamic positioning and auto-pilot functions have now become standard on many ROVs increasing operational efficiency. It will be interesting to see the next steps in the development of vehicle autonomy and self-intelligence which could lead to AUV/ROV hybrids performing tasks without pilot control. With the ready availability of broadband we may see ROVs undertaking inspection in areas such as the Arctic being controlled and monitored from an office in Aberdeen.

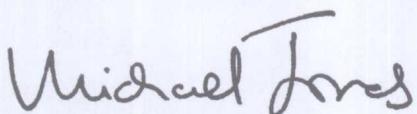

Mini ROVs continue to increase in capability and variety, providing very able tools at a low cost. There are great opportunities to use them in association with larger vehicles of all types where they can provide an extra pair of eyes or even a hand using their manipulators. There would also seem to be potential to apply the advances in 3-D cameras for the use of ROV intervention. It still defies belief how pilots can use manipulator arms without any sense of depth of field from the 2-D cameras we use today.

ROVs are also opening up new frontiers in underwater development. One of these is the mining of minerals and deposits around black smokers in deepwater seafloors. The application of technology from the oil and gas industry is making the extraction of these deposits economical at today's elevated commodity prices. High powered earth moving crawlers which have been developed to trench oil and gas pipelines for stability and protection provide a platform for deploying cutters and dredgers for removal of these remote ores. The offshore oil and gas industry has demonstrated that hydrocarbons can be extracted with regard to the environment, and these same values and standards must be pro-actively applied to this new mining industry.

ROVs will have an important part to play in the emerging offshore renewable energy market. If we are to achieve the ambitious targets we have set ourselves to increase the proportion of energy we use from renewables means these offshore wind, wave and tidal development will need to be accelerated. The safe and efficient construction and maintenance of the different forms of offshore energy capturing devices will need many different types of ROVs.

The ROV/AUV industry has always been an exciting one to be part of, but never more so than today. We all need to make sure we are playing our part to attract, develop and retain bright, young engineers. Governments and individuals are beginning to realise that successful economies cannot rely on the 'financial industry', and that high tech industries are more reliable. I would also argue it's a more fulfilling and satisfying way to spend your life's work!

I sincerely hope that you find this edition of **Remotely Operated Vehicles of the World** an interesting and informative source of reference material. The breadth and capability of the technology it describes is truly amazing. It will be interesting to refer back to it at the end of this decade and see just how far we have journeyed!
