## Foreword

With this publication, the Society for Industrial Microbiology enters a new arena in service to the applied microbiological community. Future contributions will continue to focus on areas of topical interest to that community, bringing together wherever and whenever possible the interdisciplinary flavor so necessary to successfully treat the subject encompassed by our charter.

This volume and the conference that preceded it owe their genesis and nurturing to the tireless efforts and dedication of George Somkuti, Chair of the Society for Industrial Microbiology Conference Committee, and the members of the Program Committee: A.L. Demain (Chair), T. Beppu, R. Hamill, J.C. Hunter-Cevera, R. Monaghan, S. Omura, G.A. Somkuti, and M. Weinstein.

I hope that subsequent 'Topics in Industrial Microbiology' are favored with individuals of equal devotion, for this - above all - is a requirement for a successful venture.

## Preface by authors

The material in this volume was presented at the '*First International Conference on the Biotechnology of Microbial Products*', held March 13–16, 1988, in San Diego, California, under the sponsorship of the Society for Industrial Microbiology, U.S.A. Attended by many of the scientific world's foremost authorities in the subject areas covered, the conference was dedicated to the memory of the late Professor Hamao Umezawa, the internationally recognized and respected investigator of bioactive microbial metabolites.

The establishment of this special and much-needed conference series reflects a rapidly increasing level of scientific inquiry worldwide in the search for useful microbial metabolites with other than antiinfective activities. The cases of confirmed applications and the anticipated impact of such microbial products in medicine and agriculture appear to signal the unfolding of an exciting and promising era in microbiological research that we are privileged to witness.

The new conference series, that will no doubt grow in recognition and stature, also represents the reaffirmation of the Society for Industrial Microbiology's mission, which is the '*advancement of the applied microbiological sciences*'.

## Introduction

# Hamao Umezawa and the Second Coming of Microbial Secondary Metabolites

Arnold L. Demain

Fermentation Microbiology Laboratory, Biology Department, Massachusetts Institute of Technology, Cambridge, MA, 02139 U.S.A.

With great vision, Hamao Umezawa began in the 1960's his pioneering efforts to broaden the scope of industrial microbiology to low molecular weight secondary metabolites which had activities other than, or in addition to, antibacterial, antifungal and antitumor potency. He and his colleagues at the Institute of Microbial Chemistry focused on enzyme inhibitors and over the years have discovered, isolated, purified and studied the *in vitro* and *in vivo* activity of many of these novel compounds. We are fortunate that a number of antibiotic companies, research institutes and academic laboratories throughout the world interpreted this effort in a positive way and began similar programs. Today we see on the market microbial metabolites with activities such as  $\beta$ -lactamase inhibition, immunostimulation, immunodepression, hypocholesteremic, anthelmintic, insecticidal, herbicidal, coccidiostatal, plant growth stimulation and animal growth promotion.

The above successes came about in two ways: (1) broad screening of known compounds with antibiotic and/or toxic activities and (2) screening of unknown compounds in fermentation broths for enzyme inhibition or inhibition of a target pest. Both strategies had one important concept in common, i.e. that microbial metabolites have activities other than, or in addition to, inhibition of other microbes. The outmoded concept that microbial products could only be used for curing microbial diseases was very popular during the early days of the antibiotic era and it has taken a long time to discredit this narrow view. One reason for its unfortunate perpetuation was the hesitancy of pharmacologists to inject crude (dark and ugly?) microbial broths into their animal model systems. Fortunately some enlightened (and adventurous) companies and laboratories refused to take the narrow path and broadly screened known antibiotics (which had failed as commercially important products) and mycotoxins for new activities. This led to the development of ergot alkaloids for various medical uses, monensin as a coccidiostat, gibberellin as a plant growth stimulator, zearelanone as an animal growth promotant, phosphinothricins as herbicides, and cyclosporin as an immunodepressant, the last-named virtually revolutionizing the practice of organ transplantation in medicine. The testing of unknown compounds as enzyme inhibitors in Tokyo and other places complemented the above efforts and soon resulted in the discovery of many potent inhibitors. Enzyme inhibitors which have been well accepted include those for research (antipain, pepstatin, leupeptin, cerulenin), medicine (clavulanic acid, lovastatin) and agriculture (polyoxins, phosphinothricins). Direct *in vivo* screening of fermentation broths against nematodes led to the major discovery of the potent activity of the avermectins against helminths causing disease in animals and humans.

The above successes have brought about a major change in our concepts of the potential of the microbe for the improvement of human welfare. Realization of this development led the Society for Industrial Microbiology to organize the *First International Conference on the Biotechnology of Microbial Products: 'Novel Pharmacological and Agrobiological Activities'* Indeed, it was the first special conference organized by the Society for Industrial Microbiology in recent times and most of the credit goes to the foresight, enthusiasm and energy of former President and Conference Committee Chairman, George A. Somkuti.

This book offers to the reader the flavor of the field today as an ever-increasing number of companies pursue the activities of a virtually limitless feast of secondary metabolites from microorganisms. Today's screens are searching for better immunomodulating agents, anticholesterol compounds, antitumor agents, insecticides, anthelmintics, herbicides, plant and animal growth regulators as well as receptor antagonists and agonists, antiviral agents, antiinflammatory drugs, carbohydrazine inhibitors, cardiovascular drugs, lipoxygenase inhibitors, antiulcer agents, aldose reductase inhibitors, antidiabetes agents and adenosine deaminase inhibitors, among others.

I know that the visions of Hamao Umezawa and other pioneers in this worldwide effort are reaching fruition and will continue to provide products of benefit to humankind. I know that fermentation research and development will continue to expand beyond its previous narrow focus, aided by new technologies of molecular biology and genetic engineering. I regret that Hamao Umezawa passed away before he could see the fruits of his ideas come together in San Diego in 1988. However, I am pleased that his work was presented at the Conference by his colleagues and his son and that his concepts will be advanced and spread throughout the world by publication of this volume.

Hamao Umezawa had both play and work in his life. He was interested in the great influence of the commercialization of penicillin on the antibiotic development of penicillins. His discovery of the potent antibiotic penicillin was followed by hundreds of other potent new antibiotics developed in industry based on the royalties of his inventions. He was successful in his research and teaching at the research institute. He effectively promoted the microbe's talent to provide useful antibiotics for the benefit of mankind. He believed that original and creative results could be obtained after diligent efforts, and he always committed himself completely to his work.

There is an old proverb which says that one can never be the best of one that will not catch up. Professor Hamao Umezawa (Fig. 1) was an exception reported in both academic and industrial fields. In many areas, he was not inferior to the best in the field of great endeavor.

Throughout his life, in 1985 he made his last trip. After taking a walk, it recovered with some medical effort, he attempted to return to his normal life, including travel overseas to give lectures. One year later, he was stricken by pneumonia and hospitalized, the rest of seven years reported him to be in bed.

On September 5th, 1990, Professor Umezawa died at his home which is located in the Imperial Palace grounds, which is decorated by Emperor Jimmu,

One and a half years earlier on December 1st, he passed away at the age of 84 years. His colleagues in deep sorrow.

Hamao Umezawa was born in 1904, the year son of Dr. Junichi Umezawa, the medical director of the principal hospital in the city of Obama, Fukui Prefecture, located north of Kyoto near the Sea of Japan. Obama is situated in an agricultural area of beautiful rice fields. Umezawa often remarked that he enjoyed his early childhood in that rural area, surrounded with nature.

The family moved several times, eventually settling in Tokyo. One of six sons, Umezawa and his brothers were all educated in natural science or medicine, continuing a family tradition. Umezawa's grandfather had been a physician, and three
