Preface to sixth edition

Before starting this revision, Mrs. Logan and I read a large number of comments and criticisms by teachers who had examined the fifth edition of *Introduction to Physiological and Pathological Chemistry*. This experience has made it crystal clear that it would be difficult, probably impossible, to write a text pleasing to every teacher. It was interesting to note, however, that the majority of the reviewers thought something should be added; only a few suggested deletions. For example, a number of people apparently want an extended discussion of organic chemistry. One teacher thought that more should have been written about buffers. Another thought the various clinical types of acidosis should have been explained. In view of recent developments, it was not surprising that several people thought the discussion of nucleic acids should have been lengthened. Still another thought that a table listing the radioactive isotopes used in medicine would have been desirable. We are grateful for these and numerous other suggestions, many of which have been incorporated in this edition.

The comments also made it evident that teachers of chemistry to students of nursing remain, as I have mentioned in the prefaces to previous editions, firmly entrenched in one of two camps: either they believe that chemistry should be taught with no reference to clinical medicine, or they believe that numerous references to clinical applications will stimulate the interest of the student. It is, of course, impossible to write a book satisfactory to both groups. I have chosen, as in the past, to provide a text for the latter camp. I have never been a nursing student, but I *have* been a medical student, and I remember all too vividly how most of those in my senior class wished they might have had some insight into the clinical importance of the basic sciences while they were freshmen and sophomores. I cannot imagine that the reactions of nursing students are very different. Even though the clinical situations chosen as examples may not be familiar to the student, the constant repetition of applications will, I think, prove as nothing else can that it is necessary to understand the basic sciences if modern clinical medicine and nursing are to be understood.

In each edition I have commented on the rapidity with which biochemistry is advancing. I believe I can say without reservation, however, that the last five years have surpassed all the others! I have attempted to avoid lengthening the book too greatly by making discussion as brief and as clear as possible and by placing a rather large amount of material in reduced type. In general, material is placed in reduced type to indicate that it is primarily of reference value or to indicate to teachers who teach short courses those topics that can be omitted or assigned as general reading.

Since so many teachers, including Mrs. Logan, have stressed the desirability of including more organic chemistry, this subject has been greatly expanded in this edition. Whereas in previous editions there was only one chapter on organic chemistry, in this edition there are four. The first two of these contain most of the information included previously. The third deals entirely with the isomerism of organic compounds. Some teachers may wish to omit this. It is so common these days, however, to encounter drugs that are trans- or cis- and to read about natural compounds that are D- or L- that it seems in order to provide students with an understanding of these terms. The fourth chapter devoted to organic chemistry gives a brief survey of aromatic and other cyclic compounds. To conserve space, the discussions of antibiotics, the section on chemical warfare, and the table listing organic radicals have been placed in the appendix. Mrs. Logan felt that these discussions should not be deleted, since she, at least, uses the information in her teaching.

So much new information has been added that it will be impossible to list all of it. In the first chapter, a new table of metric weights and measures includes the new units adopted in Paris in 1958 by the International Committee on Weights and Measures and more recently by our own National Bureau of Standards. The table listing the subatomic particles is bigger and more interesting than ever. Also, a brief account of the anti-particles, which also are included in the table, has been given.

In reading over the fifth edition, it suddenly occurred to me that van der Waals forces have not been discussed in any edition. Moreover, I did not find this topic mentioned in any of a half dozen or so texts for nurses that I examined. This is surprising, for without van der Waals forces there could be no liquids and no solids—only gas! It is not a difficult subject and something has been written about it in this edition. Hydrogen bonding, now known to be so important in the structures of proteins and nucleic acids, has been explained.

There is one group of diseases that is of undeniable biochemical importance, even to those who do not wish to teach applications. These are known as "inborn errors of metabolism" or as "diseases of enzymic defect." Brief discussions of a number of these have been included throughout the text and some have been assembled in a table in the chapter on enzymes. Also included in the chapter on enzymes is an example illustrating the general principle that many drugs act by reacting chemically with enzymes.

Several new applications of radioactive isotopes in diagnosis and experimental medicine have been mentioned. A table listing those radioactive isotopes that are widely used for treatment, diagnosis, and experimentation has also been included.

Recently discovered mechanisms for the synthesis of fatty acids, lecithins, and cholesterol have been described in reduced type. The increasingly important hexose monophosphate shunt is mentioned in the chapter on carbohydrate metabolism.

A description of the recently postulated structure of the DNA molecule has been included, both in words and as illustrations. An explanation of the present thinking of many biochemists as to the role DNA and RNA play in protein synthesis and in heredity is given.

An illustration of the α helix is included, and a discussion of current concepts of protein structure has been given for the first time. The new shorthand system used in writing the structures of polypeptides and proteins has been explained. The formulas and shorthand symbols of the naturally occurring amino acids have been placed in a table in the appendix.

In the last few years a number of new bleeding dyscrasias have been reported. In almost every case the cause of the bleeding is due to the lack of a sufficient amount of one of the numerous factors now known to be involved in the clotting mechanism. Since many hospital laboratories now can test for these factors, it is almost a certainty that students will be confronted with them on hospital charts. Therefore, included in reduced type is a fairly comprehensive review of present knowledge in the field of blood clotting. Included with this is a discussion of the rationale of anticoagulant therapy and its control.

The discussion of clinical acidosis and alkalosis has been expanded. Since this is a subject that readily can become confusing to a student, special effort has been made to try to make the explanations as brief and as clear as possible.

Two newly recognized hormones are described in the chapter on that subject. Relaxin was discovered some years ago, but many scientists were skeptical of its existence until recently. There can no longer be any doubt that it is a true mammalian hormone—and, as a matter of fact, that it may be important in other animal species. Relaxin now is used in medicine as a drug. Not as much is known about the other hormone, erythropoietin. There is even controversy as to the organ of the body that makes it. Nevertheless, it is established beyond doubt that blood from anemic patients or animals contains a factor that stimulates the production of new blood cells.

I have believed all along that illustrations make a book more valuable. They add interest and are excellent teaching aids. This edition contains 166 illustrations—57 more than were in the last one. In a number of cases, old illustrations have been replaced by new ones.

The present edition, as was the first and all succeeding editions, is introduced by the excellent chapter written by Katharine D. Dreves, nee Katharine Densford. Since the last issue Miss Densford has assumed emeritus status at the University of Minnesota School of Nursing and is now Mrs. Carl A. Dreves. Those of

her friends who might wish to correspond with her will be interested to know that her present address is 853 West Nebraska Ave., St. Paul 17, Minn.

Once again I would like to express my great admiration for Dr. J. F. McClen-
don, who introduced me to the science of physiological chemistry in 1931. This
remarkable man, who took his doctorate in 1906 at the University of Pennsyl-
vania, has since that time maintained a vigorous and active research program.
Even today, at his advanced age, he is pursuing important problems in the fields
of nutrition and physiological chemistry.

Also, my deepest thanks go to Miss Maureen Wade, who typed most of this
revision, and to Mrs. Rosalie Dippel and Mrs. Lynn Begemann, who assisted
her; Mr. James Skillman, who provided a number of the beautiful illustrations
and photographs used in this edition; and Dr. George Phillips and Dr. Robert
L. Kroc, who provided some of the illustrations. I am greatly indebted to Mrs.
Jane Lenahan, whom I consulted in order to write intelligently about blood
clotting. My ever-patient wife, Jennie M. Arnow, has, as always, encouraged
me to try to make this edition the finest available—even though this has meant
many hours of separation for us on week-ends and evenings.

Finally, I cannot close without expressing my deep gratitude to Mrs. Marie C.
D'Andrea Logan, who once again has worked with me during the revision of this
book. Her wise counsel and honest criticism have been most helpful.

L. Earle Arnow

Contents

PART ONE INTRODUCTION TO CHEMICAL SCIENCE

CHAPTER 1

- Introduction (Katharine Densford Dreves, R.N., B.A., M.A., D.Sc., LL.D.) 21
Reactions of students to the course in chemistry, 21; Recommended method of study, 21; Definitions, 22; Why do we study chemistry? 22; Word regarding the author, 24.

CHAPTER 2

- Metric system 26
Centigrade temperature scale, 26; Units of length, 26; Units of weight, 26; Units of volume, 29; Study questions, 29.

CHAPTER 3

- Chemical substances 30
Physical and chemical changes, 30; Simple and compound substances, 31; Elements and compounds, 31; Factors influencing the activities of substances, 32; Factors affecting the speed of chemical reactions, 33; Study questions, 34.

CHAPTER 4

- Atoms and molecules 35
Atomic theory, 35; Atomic weight, 35; Atomic numbers, 35; Molecules, 36; Molecular weight, 36; Subatomic particles, 37; Supposed structure of the atom, 37; Isotopes, 40; Van der Waals forces, 42; Study questions, 42.

CHAPTER 5

- Chemical shorthand and the concept of valence 43
Atomic symbol, 43; Formula for the compound, 43; Concept of valence, 45; Structural formula, 46; Chemical equation, 46; Radicals, 49; Prediction of the products of reaction, 50; Relationship between valence and atomic structure, 51; Study questions, 52.

12 Contents

CHAPTER 6

Oxygen 53

Occurrence, 53; Discovery of oxygen, 53; Preparation, 53; Properties, 54; Vital importance, 55; Burning, 55; Kindling temperature, 55; Extinguishing fires, 55; Importance of oxygen gas in everyday life, 56; Commercial uses of oxygen, 57; Use of oxygen in therapy, 57; Problem of the rusting of iron, 58; Oxides, 58; Study questions, 58.

CHAPTER 7

Energy transformations 60

Definition, 60; Energy conversions, 60; Measurement of energy, 60; Chemical energy, 61; Energy production from foods, 61; Study questions, 62.

CHAPTER 8

Water 63

Composition, 63; Occurrence, 63; Physical properties of biological importance, 63; Reaction with metals, 64; Reaction with oxides, 65; Hydrates, 65; Hydrolysis, 66; Study questions, 66.

CHAPTER 9

Solutions 68

Meaning of the term "solution," 68; Solvent and solute, 68; Solutions with liquid solvents, 68; Factors influencing solubility, 68; Types of solution, 69; Freezing and boiling points of solutions, 69; Methods of expressing concentration, 69; Surface tension, 71; Interfacial tension, 72; Surface active substances, 72; Emulsions, 72; Osmotic pressure, 74; Colloidal dispersions, 75; Dialysis, 76; Colloid osmotic pressure, 76; Adsorption, 77; Chromatography, 78; Study questions, 78.

CHAPTER 10

Acids, bases, and salts 80

Inorganic and organic compounds, 80; Definitions, 80; Indicators, 80; Acids, 81; General properties of acids, 81; Physical properties of acids, 84; Rules for naming acids, 84; Bases, 85; General properties of bases, 85; Physical properties of bases, 86; Rule for naming bases, 86; Salts, 87; General properties of salts, 87; Salts responsible for hard water, 88; Acid salts, 89; Rules for naming salts, 89; Study questions, 91.

CHAPTER 11

Ionization 92

Electrolytes and non-electrolytes, 92; Strong and weak electrolytes, 92; Osmotic pressure of electrolytes, 92; Theory of ionization, 94; Electrovalence and the nature of ions, 95; Covalence, 95; Conduction of an electric current by electrolyte solutions, 99; Acids and bases in water solution, 99; Salts in water solution, 100; Physiological importance of ions, 101; Equilibrium in electrolyte solutions, 101; Water as an electrolyte, 102; pH notation, 103; Importance of pH control, 104; Buffers, 105; Study questions, 106.

CHAPTER 12

Oxidation and reduction	107
Oxidation-reduction reactions, 107; Metathetic reactions, 107; Electron transfers in oxidation-reduction reactions, 107; Oxidizing and reducing agents, 108; Importance of oxidation-reduction reactions in medicine, 109; Study questions, 111.	

CHAPTER 13

Periodic table and some important elements	112
Periodicity of the elements, 112; Modern periodic table, 113; Hydrogen, 113; Alkali metals, 115; Alkaline-earth metals, 115; Boron and aluminum, 116; Silicon, tin, and lead, 116; Nitrogen, phosphorus, arsenic, antimony, and bismuth, 118; Sulfur, 119; Halogens, 120; Noble gases, 121; Copper, silver, and gold, 121; Zinc and mercury, 122; Iron, 124; Precious stones, 124; Study questions, 124.	

CHAPTER 14

Nuclear chemistry and atomic energy	126
Introduction, 126; Natural radioactivity, 126; Bombardment with charged particles, 127; Bombardment with neutrons, 130; Atomic energy, 130; Nuclear fusion, 132; Use of radioactive elements as tracers, 132; Study questions, 136.	

CHAPTER 15

Introduction to organic chemistry	137
Introduction, 137; Sources of organic compounds, 138; Importance of organic substances, 138; Comparison of organic and inorganic reactions, 138; Carbon as an element, 138; Important properties of the carbon atom, 139; Use of structural formulas in organic chemistry, 140; Saturated and unsaturated compounds, 142; Characteristic groups, 142; Divisions of organic compounds, 143; Study questions, 144.	

CHAPTER 16

Aliphatic organic compounds	145
Hydrocarbons, 145; Saturated aliphatic hydrocarbons, 145; Unsaturated aliphatic hydrocarbons, 149; Reaction of hydrocarbons with oxygen, 150; Reaction of hydrocarbons with halogens, 150; Hydrocarbon radicals, 152; Alcohols, 152; Definition, 152; Types of alcohol, 153; Comparison of alcohols and inorganic hydroxides, 153; Reactions with oxygen, 154; Some important alcohols, 154; Aldehydes and ketones, 156; Definitions, 156; Reactions, 157; Important aldehydes, 157; Important ketones, 158; Organic acids and salts, 158; Definitions and properties, 158; Typical organic acids, 159; Esters, 160; Definition and properties, 160; Important esters, 163; Ethers, 163; Amines, 164; Study questions, 166.	

CHAPTER 17

Isomerism of organic compounds	168
Introduction, 168; Chain or nuclear isomerism, 168; Geometric or cis-trans isomerism, 168; Tautomerism or dynamic isomerism, 170; Position isomerism, 170; Optical isomerism, 171; Summary, 175; Study questions, 175.	

14 Contents

CHAPTER 18

Cyclic organic compounds 176

Cycloparaffins or naphthenes, 176; Aromatic compounds, 177; Aromatic hydrocarbons, 177; Benzene, 177; Structure of benzene, 177; Properties of benzene, 181; Other important aromatic hydrocarbons, 182; Oxygen derivatives of the aromatic hydrocarbons, 184; Aromatic alcohols, 184; Benzyl alcohol, 184; Phenethyl alcohol, 184; Phenols, 185; Naphthols, 188; Alkylated phenols, 188; Aromatic aldehydes, 189; Benzaldehyde, 189; Aromatic ketones, 190; Benzophenone, 190; Acetophenone, 191; Chloracetophenone, 191; Quinones, 191; Aromatic acids, 191; Benzoic acid, 192; Salicylic acid, 192; Aromatic amines, 193; Primary aromatic amines, 193; Aniline, 193; Secondary aromatic amines, 195; Tertiary aromatic amines, 195; Dyes, 195; Heterocyclic compounds, 197; Heterocyclic compounds with five-membered rings, 198; Furane, 198; Thiophene, 198; Thiazole, 198; Pyrrole, 198; Imidazole, 199; Heterocyclic compounds with six-membered rings, 199; Pyridine, 199; Heterocyclic compounds with condensed rings, 200; Indole, 200; Quinoline, 201; Other heterocyclic compounds, 201; Ureides, 201; Pyrimidines, 202; Purines, 203; Alkaloids, 203; Study questions, 205.

PART TWO PHYSIOLOGICAL AND PATHOLOGICAL CHEMISTRY

CHAPTER 19

Nature of enzymes 209

Definitions, 209; Chemical nature of enzymes, 209; Speed of enzyme action, 209; Enzyme specificity, 210; Proenzymes, 210; Activators and inhibitors, 210; Coenzymes, 211; Types of reaction catalyzed by enzymes, 211; Autolysis, 214; Diseases of enzymic defect, 214; Mechanism of drug action, 214; Study questions, 217.

CHAPTER 20

Chemical nature of lipids 218

Definition of lipid, 218; Types of lipid, 218; Types of fatty acid, 219; Soaps, 220; Chemical nature of fats, 222; Oils, 223; Hydrogenation of fats, 223; Acrolein test, 223; Rancidity of fats, 224; Phospholipids, 224; Glycolipids, 225; Waxes, 225; Sterols, 226; Study questions, 227.

CHAPTER 21

Metabolism of lipids 228

Definition of metabolism, 228; Summary of fat digestion, 228; Anabolic products of fatty acids, 229; Functions of depot fat, 229; Catabolism of fatty acids, 230; Ketone bodies, 233; Causes of ketosis, 234; Function of the liver in fatty acid catabolism, 234; Question of conversion of fat to carbohydrate, 235; Functions of phospholipids, 235; Sterol metabolism, 236; Obesity, 239; Study questions, 241.

CHAPTER 22

Chemical nature of carbohydrates 243

Definitions, 243; Types of carbohydrate, 243; Hexoses, 243; Fermentation, 246; Pentoses, 246; Disaccharides, 247; Some important polysaccharides, 248; Glucosides, 250; Origin of carbohydrates, 250; Study questions, 251.

• CHAPTER 23

Metabolism of carbohydrates	252
Summary of carbohydrate digestion, 252; Fate of fructose and galactose, 252; Glycogen formation, 253; Glycogenolysis, 254; Blood sugar level, 254; Chemical changes in muscle contraction, 254; Metabolism of nerve tissue, 258; Conversion of carbohydrate to fat, 258; Energy of carbohydrate oxidation, 258; Protein-sparing action of carbohydrate, 259; Action of epinephrine, 259; Functions of insulin, 259; Glucagon, 262; Study questions, 264.	

CHAPTER 24

Chemical nature of proteins	265
Introduction, 265; Types of protein, 265; Isoelectric point, 266; Amino acids, 268; Methods of making proteins insoluble, 272; Protein solvents, 273; Color reactions of proteins, 274; Hemoglobin, 274; Methemoglobin, 275; Carbon monoxide poisoning, 275; Nucleoproteins, 275; Study questions, 282.	

CHAPTER 25

Metabolism of proteins	283
Summary of protein digestion, 283; Anabolic products of amino acids, 283; Essential amino acids, 283; Amino acid catabolism, 284; Fate of urea, 284; Formation of ammonium salts by the kidneys, 284; Ammonium salts in blood, 285; Energy of protein catabolism, 285; Purine metabolism, 285; Pyrimidine metabolism, 286; Creatine and creatinine, 287; Anabolism of hemoglobin, 288; Catabolism of hemoglobin, 288; Special transformations of certain amino acids in the body, 291; Glycine, 291; Cystine, 291; Tyrosine, 291; Histidine, 292; Methionine, 292; Metabolic interrelationships, 294; Study questions, 295.	

CHAPTER 26

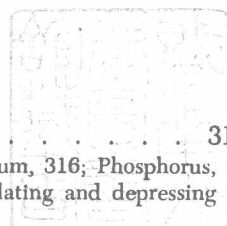

Chemistry of the digestive tract	297
Introduction, 297; Teeth, 297; Saliva, 300; Gastric juice, 300; Secretin, 304; Pancreatic juice, 305; Bile, 306; Intestinal juice, 308; Enterogastrone, 309; Bacterial action in the intestine, 309; Feces, 310; Study questions, 311.	

CHAPTER 27

Inorganic metabolism	313
Water, 313; Sodium bicarbonate, 315; Sodium chloride, 316; Calcium, 316; Phosphorus, 318; Potassium, 318; Iron, 319; Iodine, 320; Fluorine, 320; Stimulating and depressing ions, 321; Study questions, 321.	

CHAPTER 28

Blood	323
Introduction, 323; Transport of oxygen to the tissues, 327; Transport of carbon dioxide to the lungs, 328; Acid-base balance, 329; Plasma proteins, 331; Blood clotting, 335; Nonprotein nitrogen, 339; Blood sugar level, 340; Plasma lipids, 340; Some important inorganic components, 341; Study questions, 342.	

16 Contents

CHAPTER 29

Urine 344

Introduction, 344; Formation of urine, 344; Collection of urine for analysis, 345; Volume of urine, 346; Color of urine, 347; Specific gravity of urine, 347; Reaction of urine, 348; Composition of urine, 348; Abnormal components of urine, 348; Urine sediment, 350; Study questions, 355.

CHAPTER 30

Hormones 356

Introduction, 356; Hormones of the ovary, 356; Hormones of the testis, 363; Hormone of the thyroid gland, 365; Hormone of the parathyroid glands, 369; Hormones of the adrenal glands, 371; Hormone of the pancreas, 378; Hormones of the pituitary gland, 380; Miscellaneous postulated factors, 384; General adaptation syndrome, 389; Hormones of the digestive tract, 391; Antihormones, 392; Renin mechanism, 392; Study questions, 393.

CHAPTER 31

Vitamins 395

Introduction, 395; Vitamin A, 396; Provitamins, 396; Chemical nature of vitamin A, 396; Vitamin A deficiency, 396; Storage of vitamin A in the body, 399; Absorption of vitamin A, 400; Standardization and requirements of vitamin A, 400; Sources of vitamin A, 400; Vitamin B complex, 401; Thiamin (vitamin B₁), 401; Chemical nature of thiamin, 401; Thiamin deficiency, 402; Thiamin pyrophosphate as a coenzyme, 405; Absorption and storage of thiamin, 405; Requirements of thiamin, 407; Sources of thiamin, 407; Riboflavin, 407; Chemical nature of riboflavin, 407; Relation to the yellow enzyme, 407; Riboflavin in nutrition, 407; Suggested requirements of riboflavin, 408; Nicotinic acid and nicotinic acid amide, 408; Role in cell oxidations, 408; Pellagra, 409; Vitamin B₁₂ (cyanocobalamin), 411; Folic acid complex, 412; Pyridoxine, 414; Pantothenic acid, 415; Choline, 416; Biotin, 417; Inositol, 418; Ascorbic acid (vitamin C), 418; Chemical nature of ascorbic acid, 418; Deficiency of ascorbic acid, 419; Ascorbic acid deficiency in animals, 421; Requirements of ascorbic acid, 421; Food sources of ascorbic acid, 422; Citrin (vitamin P), 422; Vitamin D, 423; Chemical nature of vitamin D, 423; Supposed function of vitamin D, 424; Deficiency of vitamin D, 424; Hypervitaminosis D, 427; Standardization and requirements of vitamin D, 427; Sources of vitamin D, 427; Vitamin E, 427; Chemical nature of vitamin E, 427; Deficiency in rats, 428; Deficiency in other animals, 428; Possible role in human nutrition, 429; Sources of vitamin E, 429; Vitamin K, 429; Chemical nature of vitamin K, 429; Function of vitamin K, 430; Use of vitamin K in human pathology, 430; Sources of vitamin K, 431; Study questions, 431.

CHAPTER 32

Introduction to nutrition 433

Introduction, 433; Basal metabolism, 434; Energy requirement, 435; Protein requirement, 438; Mineral (inorganic) requirement, 440; Lipid requirement, 442; Acid and alkaline effects of foods, 443; Ketogenic and antiketogenic diets, 443; Residue and water in the diet, 443; Diet in pregnancy and lactation, 444; Nutrition in infancy and childhood, 444; Reducing diets, 447; Study questions, 452.
