GRADUATE TEXTS IN PHYSICS

Graduate Texts in Physics publishes core learning/teaching material for graduate- and advanced-level undergraduate courses on topics of current and emerging fields within physics, both pure and applied. These textbooks serve students at the MS- or PhD-level and their instructors as comprehensive sources of principles, definitions, derivations, experiments and applications (as relevant) for their mastery and teaching, respectively. International in scope and relevance, the textbooks correspond to course syllabi sufficiently to serve as required reading. Their didactic style, comprehensiveness and coverage of fundamental material also make them suitable as introductions or references for scientists entering, or requiring timely knowledge of, a research field.

Preface

In selecting the material and the presentation of this textbook I was aiming at the advanced undergraduate/first year graduate level, or so I was intending. *Chapters 1–8* (with some possible omissions and additions, depending on the students' interests and the instructor's preferences) *can serve as the core of a senior undergraduate course* on Solid State Physics addressed to students in Physics, Chemistry, Materials Science, and Engineering. The book is designed *to serve also as a textbook in a first-year graduate course* on the Physics of Solids. Some familiarity with Electromagnetism, Quantum Mechanics, and Statistical Physics is assumed; anyway, extensive outlines of these subjects are presented in Appendices A, B, and C, respectively.

The emphasis in the book is on understanding the behavior of the various types of solids at a qualitative level and on being able to derive their properties at a quantitative level. To achieve this goal, *concepts and theoretical tools are gradually introduced as needed and the results are continuously tested against the "touchstone" of experimental data.* To be more specific, the book starts with Chap. 1 by reminding the readers of the basic ideas of physics: the atomic structure of matter, the wave-particle duality (which is distilled in the three principles of Quantum Mechanics), and the minimization of the free energy as the criterion of equilibrium. The latter is established through the competition of the squeezing electrostatic forces (characterized by the proton charge, e) and the expansion-driving quantum kinetic energy (characterized by Planck's constant, \hbar , the electronic mass, m_e , and, to a lesser degree, the atomic mass, m_a). It is shown in Chap. 2 that *the basic physical constants, \hbar , m_e , e , through simple dimensional considerations and "a little thinking" allow us to derive most of the main properties of solids at a semiquantitative level.* Chapter 3, which concludes the first introductory part of the book provides a first acquaintance with solids (their various types, their periodic crystal structures, and the periodicity-based Bloch's theorem).

In the second part of the book, the two simplest approaches to the real world of solids (with diametrically opposite starting points) are presented: The *Jellium Model* (JM), more appropriate for metals, and the *linear combination*

of *atomic orbitals* (LCAO) method, capable of handling semiconductors as well as other classes of solids. The JM is treated in more details than usual, because it offers the opportunity to introduce many important concepts, to calculate explicitly quantities of interest, to compare them with experimental data, and all these in the simplest possible way and with a minimum background. The importance of the LCAO method is emphasized because of its far reaching applicability. This part is concluded in Chap. 8 with an outline of the basic conceptual framework (leading to the independent electron approximation in an effective periodic potential) together with a list of important phenomena going beyond this framework.

In the third part, consisting of Chaps. 9–12, concepts and theoretical tools associated with the periodic order of crystalline solids are presented. These concepts and tools allow us to remedy the qualitative failures of the JM and quantitative inadequacies of the LCAO method.

Equipped with this calculational arsenal, we are in a position to study in the fourth part of the book (Chaps. 13–16) not only the specific classes of solids, such as simple metals, semiconductors, ionic solids, transition metals, and artificial structures, but also particular materials.

In the fifth part of the book (Chaps. 17–19), we are forced to go beyond the familiar ground of the periodic landscape in order to examine phenomena where the breakdown or the absence of periodic order is essential. These phenomena occur in surfaces and interfaces, in glasses, amorphous solids, and other disordered systems, and in finite structures, such as clusters, quantum dots, etc.

Finally, in the sixth part of the book (Chaps. 20–23), we make another excursion to the unknown territory in order to study two important phenomena (Magnetism and Superconductivity) associated with the breakdown of the independent electron approximation and the emergence of the crucial role of correlated electronic motion.

Many *topics of current research interest* (and hopefully of future importance) have found their way in the book: Graphene, Organic Semiconductors, Photonic and Phononic Crystals, Left-Handed Metamaterials, Plasmonics, Spintronics, etc. However, important subjects such as soft matter, nonequilibrium phenomena, and devices were left out (to say nothing about experimental techniques).

I tried to make the book *self-contained* by including 65 pages of appendices (marked by a gray stripe for easy identification). In these appendices, the basic concepts and formulas of Electromagnetism, Quantum Mechanics, Thermodynamics/Statistical Mechanics, and Theory of Elasticity, as well as the LCAO method as applied to molecules are presented. In order to make the book easy to use, I have put together, at the end of the book, the important tables (again marked by a gray stripe); moreover, tables of physical constants and the atomic system of units, as well as frequently used mathematical formulas were placed inside the front and the back hard cover of the book.

I would like to thank Drs. Maria Kafesaki, Stavroula Foteinopoulou, and George Kioseoglou for reading some chapters of the book and for making useful suggestions. I would like also to acknowledge many useful discussions with colleagues concerning the content of the book and its presentation. I am grateful to Mina Papadaki for her invaluable help in bringing to conclusion this text. Finally, I am greatly indebted to the reviewers for reading my manuscript from A to Z, very carefully; they pointed out several typos and made a great number of very valuable modifications for improving the text. I express my deep appreciation and thanks to them.

July 2010

Heraklio

Contents

Part I An Overview

| | | |
|----------|--|----|
| 1 | Basic Principles Summarized | 3 |
| 1.1 | The Atomic Idea: From Elementary Particles to Solids | 4 |
| 1.2 | Permanent (i.e., Equilibrium) Structures of Matter Correspond to the Minimum of Their (Free) Energy | 6 |
| 1.3 | Condensed Matter Tends to Collapse Under the Influence of Coulomb Potential Energy | 9 |
| 1.4 | Quantum Kinetic Energy Counterbalances Coulomb Potential Energy Leading to Stable Equilibrium Structures .. | 10 |
| 1.4.1 | Heisenberg's Uncertainty Principle and the Minimum Kinetic Energy | 10 |
| 1.4.2 | Pauli's Exclusion Principle and the Enhancement of the Minimum Kinetic Energy | 11 |
| 1.4.3 | Schrödinger's Spectral Discreteness and the Rigidity of the Ground State | 14 |
| 1.5 | Dimensional Analysis | 15 |
| 1.6 | Key Points | 18 |
| 1.7 | Questions and Problems | 19 |
| 2 | Basic Principles in Action | 21 |
| 2.1 | Size and Energy Scale of Atoms | 21 |
| 2.2 | Why do Atoms Come Together to Form Molecules and Solids? | 23 |
| 2.3 | Ionic Motion: Small Oscillations | 27 |
| 2.4 | Why do the Specific Heats of Solids go to Zero as $T \rightarrow 0$ K? . | 29 |
| 2.5 | When is Classical Mechanics Adequate? | 31 |

| | | |
|----------|---|-----------|
| 2.6 | Estimating Magnitudes Through Dimensional Analysis | 32 |
| 2.6.1 | Atomic Radius, R_α | 32 |
| 2.6.2 | Volume per Atom, $\nu_a \equiv V/N_a$, in Solids | 32 |
| 2.6.3 | Mass Density, ρ_M | 33 |
| 2.6.4 | Cohesive Energy, U_c | 33 |
| 2.6.5 | Bulk Modulus, B , and Shear Modulus, μ_s | 34 |
| 2.6.6 | Sound Velocities in Solids, c_0, c_ℓ, c_t | 35 |
| 2.6.7 | Maximum Angular Frequency of Atomic Vibrations in Solids, ω_{\max} | 37 |
| 2.6.8 | Melting Temperature, T_m | 37 |
| 2.6.9 | DC Electrical Resistivity, ρ_e | 38 |
| 2.7 | Key Points | 41 |
| 2.8 | Questions and Problems | 42 |
| 3 | A First Acquaintance with Condensed Matter | 47 |
| 3.1 | Various Kinds of Condensed Matter | 47 |
| 3.1.1 | Monocrystalline and Polycrystalline Atomic Solids | 48 |
| 3.1.2 | Atomic or Ionic Compounds and Alloys | 49 |
| 3.1.3 | Molecular Solids | 49 |
| 3.1.4 | Glasses | 49 |
| 3.1.5 | Polymers | 50 |
| 3.1.6 | Colloids | 50 |
| 3.1.7 | Gels | 51 |
| 3.1.8 | Liquid Crystals | 51 |
| 3.1.9 | Self-Assembled Soft Matter | 51 |
| 3.1.10 | Artificial Structures | 52 |
| 3.1.11 | Clusters and Other Finite Systems | 52 |
| 3.2 | Bonding Types and Resulting Properties | 53 |
| 3.2.1 | Simple Metals | 54 |
| 3.2.2 | Transition Metals and Rare Earths | 55 |
| 3.2.3 | Covalent Solids | 55 |
| 3.2.4 | Ionic Solids | 56 |
| 3.2.5 | Van der Waals Bonded Solids | 57 |
| 3.2.6 | Hydrogen Bonded Solids | 58 |
| 3.3 | A Short Introduction to Crystal Structures | 59 |
| 3.3.1 | Some Basic Definitions | 59 |
| 3.3.2 | Unit and Primitive Cells of Some Commonly Occurring 3-D Crystal Structures | 64 |
| 3.3.3 | Systems and Types of 3D Bravais Lattices | 67 |
| 3.3.4 | Crystal Planes and Miller Indices | 67 |
| 3.4 | Bloch Theorem, Reciprocal Lattice, Bragg Planes, and Brillouin Zones | 70 |
| 3.4.1 | Bloch Theorem | 70 |
| 3.4.2 | Reciprocal Lattice | 72 |

| | | |
|-----|-----------------------------|----|
| | 3.4.3 Bragg Planes | 75 |
| | 3.4.4 Brillouin Zones | 75 |
| 3.5 | Key Points | 77 |
| 3.6 | Questions and Problems..... | 78 |

Part II Two Simple Models for Solids

| | | |
|----------|--|------------|
| 4 | The Jellium Model and Metals I: Equilibrium Properties .. | 83 |
| 4.1 | Introduction | 84 |
| 4.2 | Electronic Eigenfunctions, Eigenenergies, Number of States .. | 86 |
| 4.3 | Kinetic and Potential Energy, Pressures, and Elastic Moduli | 90 |
| 4.4 | Acoustic Waves are the Ionic Eigenoscillations in the JM | 97 |
| 4.5 | Thermodynamic Quantities | 101 |
| | 4.5.1 General Formulas | 101 |
| | 4.5.2 Specific Heat, C_V | 104 |
| | 4.5.3 Bulk Thermal Expansion Coefficient | 107 |
| 4.6 | Key Points | 107 |
| 4.7 | Problems | 108 |
| | | |
| 5 | The Jellium Model and Metals II: Response to External Perturbations | 113 |
| 5.1 | Response to Electric Field | 113 |
| 5.2 | The Dielectric Function | 114 |
| 5.3 | Static Electrical Conductivity | 120 |
| 5.4 | Phonon Contribution to Resistivity | 123 |
| 5.5 | Response in the Presence of a Static Uniform Magnetic Field | 127 |
| | 5.5.1 Magnetic Resonances | 128 |
| | 5.5.2 Hall Effect and Magnetoresistance | 131 |
| | 5.5.3 Magnetic Susceptibility, χ_m | 133 |
| 5.6 | Thermoelectric Response | 140 |
| 5.7 | Key Points | 143 |
| 5.8 | Problems | 145 |
| | | |
| 6 | Solids as Supergiant Molecules: LCAO | 149 |
| 6.1 | Diversion: The Coupled Pendulums Model..... | 149 |
| 6.2 | Introductory Remarks Regarding the LCAO Method..... | 152 |
| 6.3 | A Single Band One-Dimensional Elemental "Metal" | 153 |
| 6.4 | One-Dimensional Ionic "Solid" | 157 |
| 6.5 | One-Dimensional Molecular "Solid" | 160 |
| 6.6 | Diversion: Eigenoscillations in One-Dimensional "solid" with two Atoms Per Primitive Cell | 163 |
| 6.7 | One-Dimensional Elemental sp^1 "Semiconductor" | 164 |

| | | |
|----------|---|------------|
| 6.8 | One-Dimensional Compound sp^1 "Semiconductor" | 171 |
| 6.9 | Key Points | 174 |
| 6.10 | Problems | 174 |
| 7 | Semiconductors and Other Tetravalent Solids | 177 |
| 7.1 | Lattice Structures: A Reminder | 177 |
| 7.2 | Band Edges and Gap | 178 |
| 7.3 | Differences Between the 1-D and the 3-D Case and Energy Diagrams | 181 |
| 7.4 | Metals, Semiconductors, and Ionic Insulators | 183 |
| 7.5 | Holes | 184 |
| 7.6 | Effective Masses and DOS | 186 |
| 7.7 | Dielectric Function and Optical Absorption | 188 |
| 7.8 | Effective Hamiltonian | 189 |
| 7.9 | Impurity Levels | 191 |
| | 7.9.1 Impurity Levels: The General Picture | 191 |
| | 7.9.2 Impurity Levels: Doping | 192 |
| 7.10 | Concentration of Electrons and Holes at Temperature T | 195 |
| | 7.10.1 Intrinsic case | 197 |
| | 7.10.2 Extrinsic case | 197 |
| 7.11 | Band Structure and Electronic DOS | 198 |
| 7.12 | Eigenfrequencies, Phononic DOS, and Dielectric Function .. | 200 |
| 7.13 | Key Points | 207 |
| 7.14 | Problems | 208 |
| 8 | Beyond the Jellium and the LCAO: An Outline | 211 |
| 8.1 | Introductory Remarks | 211 |
| 8.2 | The Four Basic Approximations | 212 |
| 8.3 | Density Functional Theory | 215 |
| 8.4 | Outline of an Advanced Scheme for Calculating the Properties of Solids | 219 |
| 8.5 | Beyond the Four Basic Approximations | 221 |
| | 8.5.1 Periodicity Broken or Absent | 223 |
| | 8.5.2 Electron–Electron Correlations, Quasi-Particles, Magnetic Phases, and Superconductivity | 235 |
| | 8.5.3 Electron–Phonon Interactions, Transport Properties, Superconductivity, and Polarons | 237 |
| | 8.5.4 Phonon–Phonon Interactions, Thermal Expansion, Melting, Structural Phase Transitions, Solitons, Breathers | 238 |
| | 8.5.5 Disorder and Many Body Effects in Coexistence | 239 |
| | 8.5.6 Quantum Informatics and Solid State Systems | 240 |
| 8.6 | Key Points | 240 |
| 8.7 | Problems | 241 |

Part III More About Periodicity & its Consequences

| | | |
|-----------|---|-----|
| 9 | Crystal Structure and Ionic Vibrations | 245 |
| 9.1 | Experimental Determination of Crystal Structures | 245 |
| 9.2 | Determination of the Frequency vs. Wavevector | 251 |
| 9.3 | Theoretical Calculation of the Phonon Dispersion Relation .. | 256 |
| 9.4 | The Debye–Waller Factor and the Inelastic Cross-Section ... | 263 |
| 9.5 | Key Points | 268 |
| 9.6 | Problems | 269 |
