三角解法問答

I. 式之變形

(一) 銳角三角式之變形 及數值計算問題

(A) 摘要

$$\begin{aligned} \sin A \cosec A &= 1 \dots (1) \\ \cos A \sec A &= 1 \dots (2) \\ \tan A \cot A &= 1 \dots (3) \end{aligned} \quad \left. \begin{array}{l} (A) \text{ 又} \\ \cosec A = \frac{1}{\sin A} \\ \sec A = \frac{1}{\cos A} \\ \cot A = \frac{1}{\tan A} \end{array} \right\}$$

$$\begin{aligned} \tan A &= \frac{\sin A}{\cos A} \dots (4) \\ \cot A &= \frac{\cos A}{\sin A} \dots (5) \end{aligned} \quad \left. \begin{array}{l} (B) \text{ 又} \\ \tan A \cos A = \sin A \\ \cot A \sin A = \cos A \end{array} \right\}$$
$$\begin{aligned} \sin^2 A + \cos^2 A &= 1 \dots (6) \\ 1 + \tan^2 A &= \sec^2 A \dots (7) \\ 1 + \cot^2 A &= \cosec^2 A \dots (8) \end{aligned} \quad \left. \begin{array}{l} (C) \end{array} \right\}$$

(B) 問題反解法

(1) $(\cos A + \sin A)^2 + (\cos A - \sin A)^2$ 試簡單之

$$\begin{aligned}
 \text{解: } & \text{原式} = \cos^2 A + 2\cos A \sin A + \sin^2 A + \cos^2 A \\
 & - 2 \cos A \sin A + \sin^2 A \\
 & = 2(\cos^2 A + \sin^2 A) = 2
 \end{aligned}$$

(2) 試變 $\sin^4 A + \cos^4 A$ 為 $1 - 2\sin^2 A \cos^2 A$

$$\begin{aligned}
 \text{解: } & \sin^4 A + \cos^4 A = \sin^4 A + 2\sin^2 A \cos^2 A + \cos^4 A \\
 & - 2\sin^2 A \cos^2 A \\
 & = (\sin^2 A + \cos^2 A)^2 - 2\sin^2 A \cos^2 A \\
 & = 1 - 2\sin^2 A \cos^2 A
 \end{aligned}$$

(3) 試簡單 $\frac{1}{1+\sin\theta} + \frac{1}{1-\sin\theta}$

$$\begin{aligned}
 \text{解: } & \text{原式} = \frac{1-\sin\theta}{1+\sin\theta} - \frac{1+\sin\theta}{1-\sin\theta} \\
 & = \frac{2}{1-\sin\theta} = \frac{2}{\cos^2\theta} = 2\sec^2\theta
 \end{aligned}$$

(4) $\sec^2\alpha + \operatorname{cosec}\alpha$ 試簡單之

$$\begin{aligned}
 \text{解: } & \text{原式} = \frac{1}{\cos\alpha} + \frac{1}{\sin\alpha} = \frac{\sin^2\alpha + \cos^2\alpha}{\cos^2\alpha \sin^2\alpha} \\
 & = \frac{1}{\cos\alpha \sin^2\alpha} = \sec^2\alpha \operatorname{cosec}\alpha
 \end{aligned}$$

(5) 試將 $(\tan A + \sec A)^2$ 以 $\sin A$ 項表之

$$\text{解: } (\tan A + \sec A)^2 = \left(\frac{\sin A}{\cos A} + \frac{1}{\cos A} \right)^2 = \left(\frac{\sin A + 1}{\cos A} \right)^2$$

$$=\frac{(1+\sin A)^2}{\cos^2 A} = \frac{(1+\sin A)^2}{1-\sin^2 A}$$

$$=\frac{(1+\sin A)^2}{(1+\sin A)(1-\sin A)} = \frac{1+\sin A}{1-\sin A}$$

(6) $\frac{\tan \alpha + \tan \beta}{\cot \alpha + \cot \beta}$ 試簡單之

解：原式 $= \frac{\tan \alpha + \tan \beta}{\frac{1}{\tan \alpha} + \frac{1}{\tan \beta}} = \frac{\tan \alpha + \tan \beta}{\frac{1}{\tan \alpha} + \frac{1}{\tan \beta}} = \tan \alpha \tan \beta$

(7) $(1+\sin A + \cos A)^2 = 2(1+\sin A)(1+\cos A)$

解：左邊 $= [(1+\sin A) + \cos A]^2$

$$\begin{aligned} &= (1+\sin A)^2 + 2(1+\sin A)\cos A + \cos^2 A \\ &= (1+\sin A)^2 + 2(1+\sin A) + 1 - \sin^2 A \\ &= (1+\sin A)(1+\sin A + 2\cos A + 1 - \sin A) \\ &= 2(1+\sin A)(1+\cos A) \end{aligned}$$

(8) $\tan \theta \frac{1-\sin \theta}{1+\cos \theta} = \cot \theta \frac{1-\cos \theta}{1+\sin \theta}$ 試證明之

解：左邊 $= \cot \theta \tan^2 \theta \frac{1-\sin \theta}{1+\cos \theta}$

$$= \cot \theta \frac{\sin^2 \theta}{\cos^2 \theta} \cdot \frac{1-\sin \theta}{1+\cos \theta}$$

$$= \cot\theta \frac{1-\cos^2\theta}{1-\sin^2\theta} \cdot \frac{1-\sin\theta}{1+\cos\theta} = \cot\theta \frac{1-\cos\theta}{1+\sin\theta}$$

$$\begin{aligned} \text{(別解1)} \quad & \frac{1-\sin\theta}{1+\cos\theta} = \frac{1-\cos\theta}{1+\sin\theta} \cdot \frac{1+\sin\theta}{1-\cos\theta} \cdot \frac{1-\sin\theta}{1+\cos\theta} \\ & = \frac{1-\cos\theta}{1+\sin\theta} \cdot \frac{1-\sin^2\theta}{1-\cos^2\theta} = \frac{1-\cos\theta}{1+\sin\theta} \cdot \frac{\cos^2\theta}{\sin^2\theta} \\ & = \frac{1-\cos\theta}{1+\sin\theta} \cot^2\theta \end{aligned}$$

$$\therefore \text{左邊} = \tan\theta \cot^2\theta \frac{1-\cos\theta}{1+\sin\theta} = \cot\theta \frac{1-\cos\theta}{1+\sin\theta}$$

(別解2) 本式去分母

$$\tan\theta(1-\sin\theta)(1+\sin\theta)$$

$$= \cot\theta(1-\cos\theta)(1+\cos\theta) \dots \dots \dots (1)$$

$$\text{然 } \tan\theta(1-\sin\theta)(1+\sin\theta) = \tan\theta(1-\sin\theta)$$

$$= \tan\theta \csc^2\theta$$

$$= \frac{\sin\theta}{\cos^2\theta} \cos^2\theta = \sin\theta \cos\theta$$

$$\cot\theta(1-\cos\theta)(1+\cos\theta) = \cot\theta(1-\cos^2\theta)$$

$$= \cot\theta \sin^2\theta$$

$$= \frac{\cos\theta}{\sin\theta} \sin^2\theta = \sin\theta \csc\theta$$

故(1)式左邊之值等於右邊之值

$$\therefore \tan \theta (1 - \sin \theta)(b + \sin \theta) = \cot \theta$$

$$(1 - \cos \theta)(1 + \cos \theta)$$

$$\therefore \tan \theta \frac{1 - \sin \theta}{1 + \cos \theta} = \cot \theta \frac{1 - \cos \theta}{1 + \sin \theta}$$

(9) 試證明下式

$$\sec A + \tan A = \frac{1}{\sec A - \tan A}$$

解：由公式 $1 + \tan^2 A = \sec^2 A$

$$\sec^2 A - \tan^2 A = 1$$

$$\therefore (\sec A + \tan A)(\sec A - \tan A) = 1$$

$$\therefore \sec A + \tan A = \frac{1}{\sec A - \tan A}$$

數值計算問題

$$(1) \tan \theta = \frac{m^2 + 2mn}{2mi + 2n^2} \text{ 時 cosec } \theta \text{ 之值如何試求之}$$

$$\text{解： } \tan \theta = \frac{m^2 + 2mn}{2mn + 2n^2} \text{ 故 } \cot \theta = \frac{2mn + 2n^2}{m^2 + 2mn}$$

$$\begin{aligned}\therefore \cosec^2 \theta &= 1 + \cot^2 \theta = 1 + \left(\frac{2mn + 2n^2}{m^2 + 2mn} \right)^2 \\ &= \frac{(m^2 + 2mn)^2 + (2mn + 2n^2)^2}{(m^2 + 2mn)^2}\end{aligned}$$

$$\text{然分子} = m^4 + 4mn + 4m^2n^2 + 4n^2(m+n)^2$$

$$= m^4 + 4m^2n(m+n) + 4n^2(m+n)^2 \\ = (m^2 + 2n(m+n))^2 = (m+2mn+2n^2)^2$$

$$\therefore \csc^2 \theta = \frac{(m^2 + 2mn + 2n^2)^2}{(m^2 + 2mn)^2}$$

$$\therefore \csc \theta = \pm \frac{m^2 + 2mn + 2n^2}{m^2 + 2mn}$$

但 θ 為銳角則將負號棄之

$$\text{答} \quad \csc \theta = \frac{m + 2mn + 2n^2}{m^2 + 2mn}$$

$$(2) \tan \theta = \frac{a}{b} \text{ 時, 試求 } a \cos \theta + b \sin \theta \text{ 之值,}$$

解: 由公式 $1 + \tan^2 \theta = \sec^2 \theta = \frac{1}{\cos^2 \theta}$

$$\cos^2 \theta = \frac{1}{1 + \tan^2 \theta} = \frac{1}{1 + \frac{a^2}{b^2}} = \frac{b^2}{a^2 + b^2}$$

$$\therefore \cos \theta = \frac{1}{\sqrt{a^2 + b^2}} \quad (\text{因 } \theta \text{ 為銳角故棄負號})$$

$$\text{次由公式 } \tan \theta = \frac{\sin \theta}{\cos \theta}$$

$$\sin \theta = \tan \theta \cdot \cos \theta = \frac{a}{b} \cdot \frac{b}{\sqrt{a^2 + b^2}} = \frac{a}{\sqrt{a^2 + b^2}}$$

$$\therefore \text{原式} = \frac{ab}{\sqrt{a^2+b^2}} + \frac{ab}{\sqrt{a^2+b^2}} = \frac{a}{\sqrt{a^2+b^2}}$$

(3) $\operatorname{cosec} \alpha = 3$ 時，試求 $\sec \alpha - \tan \alpha$ 之值，

$$\text{解： } \operatorname{cosec} \alpha - \tan \alpha = \frac{1}{\cos \alpha} - \frac{\sin \alpha}{\cos \alpha} = \frac{1 - \sin \alpha}{\cos \alpha}$$

$$\text{然 } \sin \alpha = \frac{1}{\operatorname{cosec} \alpha} = \frac{1}{3}$$

$$\therefore \cos^2 \alpha = 1 - \sin^2 \alpha = 1 - \frac{1}{9} = \frac{8}{9}$$

$$\therefore \cos \alpha = \frac{2\sqrt{2}}{3} \quad (\text{但 } \alpha \text{ 為銳角})$$

$$\therefore \sec \alpha - \tan \alpha = \frac{1 - \frac{1}{3}}{\frac{2\sqrt{2}}{3}} = \frac{2}{2\sqrt{2}} = \frac{\sqrt{2}}{2}$$

(4) $\cot A = \frac{p}{q}$ 時 則 $\frac{p \cos A - q \sin A}{p \cos A + q \sin A}$ 之值如何？

$$\text{解： } \frac{p \cos A - q \sin A}{p \cos A + q \sin A} = \frac{p \cot A - q}{p \cot A + q}$$

$$= \frac{p \cdot \frac{p}{q} - q}{p \cdot \frac{p}{q} + q} = \frac{p^2 - q^2}{p^2 + q^2}$$

(別解) 由公式 $\cot A = \frac{\cos A}{\sin A}$

$$\frac{\cos A}{\sin A} = \frac{p}{q} \quad \therefore \frac{\cos A}{p} = \frac{\sin A}{q} = k$$

$$\therefore \cos A = pk \quad \sin A = qk$$

以此代入本式

$$\frac{p \cos A - q \sin A}{p \cos A + q \sin A} = \frac{p^2 k - q^2 k}{p^2 k + q^2 k} = \frac{p^2 - q^2}{p^2 + q^2}$$

(二) 餘角三角式之變形

(A) 摘要

$$\begin{cases} \sin(90^\circ - A) = \cos A \\ \cos(90^\circ - A) = \sin A \\ \tan(90^\circ - A) = \cot A \end{cases}$$

$$\begin{cases} \cosec(90^\circ - A) = \sec A \\ \sec(90^\circ - A) = \cosec A \\ \cot(90^\circ - A) = \tan A \end{cases}$$

$$\begin{cases} \sin 0^\circ = \cos 90^\circ = 0 \\ \cos 0^\circ = \sin 90^\circ = 1 \\ \tan 0^\circ = \cot 90^\circ = 0 \\ \cot 0^\circ = \tan 90^\circ = \pm\infty \end{cases}$$

$$\begin{cases} \sin 30^\circ = \cos 60^\circ = \frac{1}{2} \\ \cos 30^\circ = \sin 60^\circ = \frac{\sqrt{3}}{2} \\ \tan 30^\circ = \cot 60^\circ = \frac{1}{\sqrt{3}} \\ \cot 30^\circ = \tan 60^\circ = \sqrt{3} \end{cases}$$

$$\begin{cases} \sin 45^\circ = \cos 45^\circ = \frac{1}{\sqrt{2}} \\ \tan 45^\circ = \cot 45^\circ = 1 \end{cases} \quad \sin 18^\circ = \frac{\sqrt{5}-1}{4}$$

(B) 問題及解法

(1) 下式試簡單之

$$\cot(90^\circ - A) \cot A \cos(90^\circ - A) \tan(90^\circ - A)$$

解： $\cot(90^\circ - A) = \tan A$, $\cos(90^\circ - A) = \sin A$

$$\tan(90^\circ - A) = \cot A$$

\therefore 原式 = $\tan A \cot A \sin A \cot A$

然 $\tan A \cot A = 1$

$$\therefore \text{原式} = \sin A \frac{\cos A}{\sin A} = \cos A$$

(2) $\sin^2(45^\circ + A) + \sin^2(45^\circ - A) = 1$ 試證明之

解：因 $(45^\circ + A) + (45^\circ - A) = 90^\circ$

故 $45^\circ + A$ 與 $45^\circ - A$ 互為餘角，

$$\sin(45^\circ - A) = \cos(45^\circ + A)$$

$$\begin{aligned}\therefore \sin^2(45^\circ + A) + \sin^2(45^\circ - A) \\ &= \sin^2(45^\circ + A) \cos^2(45^\circ + A) = 1.\end{aligned}$$

(三) 一般角三角函數式之變形

及數值計算問題

問題及解法

$$(1) \frac{\sin(180^\circ - \alpha)}{\tan(180^\circ + \alpha)} \times \frac{\cot(90^\circ - \alpha)}{\tan(90^\circ + \alpha)}$$

$$\times \frac{\cos(360^\circ - \alpha)}{\sin(-\alpha)} \text{ 試簡單之，}$$

解：
 $\sin(180^\circ - \alpha) = \sin \alpha \quad \tan(180^\circ + \alpha) = \tan \alpha$
 $\cot(90^\circ - \alpha) = \tan \alpha \quad \tan(90^\circ + \alpha) = -\cot \alpha$
 $\cos(360^\circ - \alpha) = \cos \alpha \quad \sin(-\alpha) = -\sin \alpha$

$$\begin{aligned} \text{故原式} &= \frac{\sin \alpha}{\tan \alpha} \times \frac{\tan \alpha}{-\cot \alpha} \times \frac{\cos \alpha}{-\sin \alpha} = \frac{\cos \alpha}{\cot \alpha} \\ &= \cos \alpha \times \frac{\sin \alpha}{\cos \alpha} = \sin \alpha. \end{aligned}$$

(2) $\tan 238^\circ = \frac{8}{5}$ 時， $\sin 238^\circ$ 之值如何？

解： 238° 為第三象限之角，故其正弦之值為負，因之
 $\alpha = 238^\circ \sin \alpha$ 以既知數 $\tan \alpha$ 之項表示之時，其
 符號為負，

$$\sin \alpha = \tan \alpha \cos \alpha = -\frac{\tan \alpha}{\sqrt{1 + \tan^2 \alpha}}$$

然 $\tan \alpha = \frac{8}{5}$

$$\text{故 } \sin \alpha = -\frac{\frac{8}{5}}{\sqrt{1 + (\frac{8}{5})^2}} = -\frac{8}{\sqrt{89}} = -\frac{8\sqrt{89}}{89}$$

(四) 角之和及差之三角公式
及數值計算問題

(A) 摘要

(1) 二角之和及差之三角公式

$$\left. \begin{array}{l} \sin(\alpha \pm \beta) = \sin\alpha \cos\beta \pm \cos\alpha \sin\beta \\ \cos(\alpha \pm \beta) = \cos\alpha \cos\beta \mp \sin\alpha \sin\beta \\ \tan(\alpha \pm \beta) = \frac{\tan\alpha \pm \tan\beta}{1 \mp \tan\alpha \tan\beta} \end{array} \right\} \dots\dots\dots(A)$$

(2) 二倍角或半角之三角公式

$$\left. \begin{array}{l} \sin 2A = 2 \sin A \cos A \\ \cos 2A = \cos^2 A - \sin^2 A \\ \quad = 1 - 2 \sin^2 A = 2 \cos^2 A - 1 \\ \tan 2A = \frac{2 \tan A}{1 - \tan^2 A} \end{array} \right\} \dots\dots\dots(B)$$

(3) 半角之三角公式

$$\left. \begin{array}{l} 1 + \cos A = 2 \cos^2 \frac{A}{2} \\ 1 - \cos A = 2 \sin^2 \frac{A}{2} \\ \frac{1 - \cos A}{1 + \cos A} = \tan^2 \frac{A}{2} \end{array} \right\} \dots\dots\dots(C)$$

(4) 三倍角之三角公式

$$\left. \begin{array}{l} \sin 3A = 3 \sin A - 4 \sin^3 A \\ \cos 3A = 4 \cos^3 A - 3 \cos A \\ \tan 3A = \frac{3 \tan A - \tan^3 A}{1 - 3 \tan^2 A} \end{array} \right\} \dots \dots \dots \quad (D)$$

(B) 問題及解法

(1) 試變 $\tan A + \tan B$ 為積形，

$$\begin{aligned} \text{解： 原式} &= \frac{\sin A}{\cos A} + \frac{\sin B}{\cos B} \\ &= \frac{\sin A \cos B + \cos A \sin B}{\cos A \cos B} \\ &= \frac{\sin(A+B)}{\cos A \cos B} \end{aligned}$$

(2) $\tan(45^\circ + A) - \tan(45^\circ - A)$ 試簡單之

$$\begin{aligned} \text{解： 原式} &= \frac{1 + \tan A}{1 - \tan A} - \frac{1 - \tan A}{1 + \tan A} \\ &= \frac{(1 + \tan A)^2 - (1 - \tan A)^2}{(1 + \tan A)(1 - \tan A)} \\ &= \frac{4 \tan A}{1 - \tan^2 A} = 2 \tan^2 A \end{aligned}$$

(3) $\frac{\sin \theta}{1 + \cos \theta}$ 試簡單之

解：

$$\text{原式} = \frac{2\sin\frac{\theta}{2}\cos\frac{\theta}{2}}{2\cos^2\frac{\theta}{2}} = \frac{\sin\frac{\theta}{2}}{\cos\frac{\theta}{2}} = \tan\frac{\theta}{2}$$

(4) $\cos 4\theta - 4\cos 2\theta + 3 = 8\sin^4\theta$ 試證之

解：

$$\begin{aligned} \cos 4\theta - 4\cos 2\theta + 3 &= \cos 4\theta - 1 - 4\cos 2\theta + 4 \\ &= 4(1 - \cos 2\theta) - (1 - \cos 4\theta) \\ &= 8\sin^2\theta - 2\sin^2 2\theta \\ &\quad - 8\sin^2\theta - 2 \times 4\sin^2\theta \cos^2\theta \\ &= 8\sin^2\theta(1 - \cos^2\theta) = 8\sin^4\theta \end{aligned}$$

(5) $\frac{1+\sin\theta}{1-\sin\theta} = \tan^2\left(45^\circ + \frac{\theta}{2}\right)$ 試證明之

解：

$$\frac{1+\sin\theta}{1-\sin\theta} = \frac{\sin^2\frac{\theta}{2} + \cos^2\frac{\theta}{2} + 2\sin\frac{\theta}{2}\cos\frac{\theta}{2}}{\sin^2\frac{\theta}{2} + \cos^2\frac{\theta}{2} - 2\sin\frac{\theta}{2}\cos\frac{\theta}{2}} \quad \dots(1)$$

$$= \frac{\left(\cos\frac{\theta}{2} + \sin\frac{\theta}{2}\right)^2}{\left(\cos\frac{\theta}{2} - \sin\frac{\theta}{2}\right)^2} = \left\{ \frac{\cos\frac{\theta}{2} + \sin\frac{\theta}{2}}{\cos\frac{\theta}{2} - \sin\frac{\theta}{2}} \right\}^2$$

兩項以 $\cos\frac{\theta}{2}$ 除之 $= \left\{ \frac{1 + \tan\frac{\theta}{2}}{1 - \tan\frac{\theta}{2}} \right\}^2$

$$= \left\{ \frac{\tan 45^\circ + \tan \frac{\theta}{2}}{1 - \tan 45^\circ \tan \frac{\theta}{2}} \right\}^2$$

$$= \tan^2 \left(45^\circ + \frac{\theta}{2} \right)$$

(別解) $\frac{1+\sin\theta}{1-\sin\theta} = \frac{1+\cos(90^\circ-\theta)}{1-\cos(90^\circ-\theta)} = \frac{2\cos^2(45^\circ-\frac{\theta}{2})}{2\sin^2(45^\circ-\frac{\theta}{2})}$

$$= \cot^2 \left(45^\circ - \frac{\theta}{2} \right) = \tan^2 \left(45^\circ + \frac{\theta}{2} \right)$$

(6) 試化 $\sec\theta + \tan\theta$ 為 $\tan\left(45^\circ + \frac{\theta}{2}\right)$ 之形

解: $\sec\theta + \tan\theta = \frac{1}{\cos\theta} + \frac{\sin\theta}{\cos\theta} = \frac{1+\sin\theta}{\cos\theta}$

$$= \frac{\sin^2 \frac{\theta}{2} + \cos^2 \frac{\theta}{2} + 2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}}{\cos^2 \frac{\theta}{2} - \sin^2 \frac{\theta}{2}}$$

$$= \frac{\left(\cos \frac{\theta}{2} + \sin \frac{\theta}{2}\right)^2}{\left(\cos \frac{\theta}{2} + \sin \frac{\theta}{2}\right)\left(\cos \frac{\theta}{2} - \sin \frac{\theta}{2}\right)}$$

$$= \frac{\cos \frac{\theta}{2} + \sin \frac{\theta}{2}}{\cos \frac{\theta}{2} - \sin \frac{\theta}{2}} = \frac{1 + \frac{\sin \frac{\theta}{2}}{\cos \frac{\theta}{2}}}{1 - \frac{\sin \frac{\theta}{2}}{\cos \frac{\theta}{2}}}$$

$$= \frac{1 + \tan \frac{\theta}{2}}{1 - \tan \frac{\theta}{2}} = \tan\left(45^\circ + \frac{\theta}{2}\right)$$

(別解) $\sec \theta + \tan \theta = \frac{1 + \sin \theta}{\cos \theta} = \frac{1 - \cos(90^\circ + \theta)}{\sin(90^\circ + \theta)}$

$$= \frac{2 \sin^2\left(45^\circ + \frac{\theta}{2}\right)}{2 \sin\left(45^\circ + \frac{\theta}{2}\right) \cos\left(45^\circ + \frac{\theta}{2}\right)}$$

$$= \tan\left(45^\circ + \frac{\theta}{2}\right)$$

數值計算問題

(1) $\sin A = \frac{5}{13}$, $\cos B = \frac{3}{5}$ 試計算 $\cos(A+B)$ 之值

但 A 為鈍角，B 為銳角，

解： $\sin A = \frac{5}{13}$ ， $\cos B = \frac{3}{5}$ 故

$$\cos A = \pm \sqrt{1 - \sin^2 A} = \pm \sqrt{1 - \left(\frac{5}{13}\right)^2} = \pm \frac{12}{13}$$

$$\sin B = \pm \sqrt{1 - \cos^2 B} = \pm \sqrt{1 + \left(\frac{3}{5}\right)^2} = \pm \frac{4}{5}$$

然 A 為鈍角，B 為銳角，故定其符號為

$$\cos A = -\frac{12}{13}，\sin B = \frac{4}{5}$$

$$\therefore \cos(A+B) = \cos A \cos B - \sin A \sin B$$

$$= -\frac{12}{13} \times \frac{3}{5} - \frac{5}{13} \times \frac{4}{5} = -\frac{56}{66} \text{ (答)}$$

$$(2) \quad \sin A = \frac{3}{5} \text{ 時，} \sin 2A \text{ 之值如何？}$$

$$\text{但 } 90^\circ < A < 135^\circ$$

$$\text{解：} \cos A = \pm \sqrt{1 - \sin^2 A} = \pm \frac{4}{5}$$

$$\text{然 A 為第二象限之角. 故 } \cos A = -\frac{4}{5}$$

$$\therefore \sin 2A = 2 \sin A \cos A = -2 \times \frac{3}{5} \times \frac{4}{5} = -\frac{24}{25} \text{ (答)}$$

$$(3) \quad \cos \alpha = \frac{1}{3} \text{ 時 } \cos \frac{\alpha}{3} \text{ 之值？但 } 180^\circ < \alpha < 360^\circ$$
